CAMPANALOGIA:

OR THE

ART

OF

RINGING

Improved.

With plain and easie Rules to guide the

Practitioner in the Ringing all kinds of

Changes.

TO

Which is added, great variety of
NEW PEALS.

LONDON,

Printed by *W. Godbid*, for *W.S.* and are to be sold by *Langley Curtis* in
Goat-Court on *Ludgate-hill*. 1677.

TO
THE HONOURED
AND TO
His much Esteemed FRIENDS,
The Members of the Society of
COLLEDG YOUTHS.

Gentlemen,

As your Society even *ab origine* hath deservedly acquired an eminency in many respects above others of this kind; so more especially for the pregnancy of its Members in the composing of *Peals*. For when the Art of *Cross-pricking* lay enveloped in such obscurity, that it was thought impossible that double Changes on five bells could be made to extend farther than *ten*, and triple and double Changes on six farther than *sixty*; then it was that a worthy and knowing Member of your Society, to dissipate those mists of Ignorance, and to usher in the bright morn of Knowledge, prickt those much applauded Peals of *Grandsire* and *Grandsire Bob*; which for their excellency have for many years together continued triumphant in practice amidst all others whatsoever; and which indeed have been a great light in the production of that great variety of new Peals herein contained; the greatest part of which being also the offspring of your Society, I therefore thought fit to usher them into the world under the wings of your Protection.

Gentlemen, as a member I held my self obliged to add my Mite to your full fraught Treasury of Speculative and Practical Knowledge of this kind; though I confess your acquisition on this account will be very mean, since my want of ability sufficient to undertake a thing of this nature, and also

want of opportunity by converse with others to supply my own defects, have rendred the Book less acceptable than it might have been done by some more knowing head and acuter Pen. And although I am conscious that it meriteth not your acceptance; yet I assume the confidence to believe that you will favour it with a kind entertainment amongst you; and the rather, for that I know you are too judicious to sentence it without first casting into the ballance of your indifferent judgments some Grains of Allowance: The countenance you shew it will silence Detractors, and be Armour of proof against the fools bolts which may happen to be soon shot at the Author, who is

Gentlemen,

*A constant well-wisher to
the Prosperity (though an
unworthy member)
of your Society,*

F.S.

ERRATA.

Courteous Reader,

Some few faults have escaped the Press: as page [27](#) line the 4th, for grateful read graceful. page [31](#). line the 19th. for imitatieg read imitating, with some others, which you are desired either candidly to amend, or tasitly to pass over.

OF THE ART OF Changes.

These clear dayes of Knowledge, that have ransackt the dark corners of most Arts and Sciences, and freed their hidden mysteries from the bonds of obscurity, have also registred this of *Ringing*, in the Catalogue of their Improvements; as well the Speculative as the Practick part, which of late years remain'd in *Embryo*, are now become perfect, and worthy the knowledge of the most ingenious. Although the Practick part of *Ringing* is chiefly the subject of this Discourse, yet first I will speak something of the Art of *Changes*, its Invention being Mathematical, and produceth incredible effects, as hereafter will appear. But first, I will premise a word or two, to shew what the nature of those *Changes* are. Some certain number of things are presupposed to be changed or varied; as 2.3.4.5.6. or any greater number whatsoever; then the number of things to be so varied must have the like number of fixed places assigned them. As if five men were sitting upon five stools in a row; the stools are supposed to be fixed places for the five men, but the men by consent may move or change to each others places at pleasure, yet still sitting in a row as at first: now this Art directs how, and in what order those five men may change places with each other, whereby they may sit sixscore times in a row, and not twice alike. And likewise a *Peal* of five Bells, being raised up to a fit compass for ringing of *Changes*, are there supposed to have five fixed places, which time assigns to their notes or strokes; yet the notes of the Bells may change into each others places at pleasure: now this Art also directs the manner and method of

changing the five notes in such sort, that they may strike sixscore times round, and not twice alike.

The numbers of *Changes* are thus to be discovered. *Two* must first be admitted to be varied two wayes; then to find out the *Changes* in *three*, the *Changes* on two must be multiplied by three, and the product will be six, which are the compleat number of *Changes* on three.

Those six *Changes* being multiplied by four, will produce 24, which are the compleat number of *Changes* on four. The 24 *Changes* on four, being multiplied by five, will produce 120, which are the compleat number of *Changes* on five. And in like manner the 120, being multiplied by six, will produce 720, which are the compleat number on six. The 720, being multiplied, by seven, will produce 5040, which are the number of *Changes* on seven. The 5040, being multiplied by eight, will produce 40320, which are the number of *Changes* on eight. Those *Changes* on eight, being multiplied by nine, will produce 362880, which are the number of *Changes* on nine. Those *Changes* on nine, being multiplied by ten, will produce 3628800, which are the number on ten. Those on ten, being multiplied by eleven, will produce 39916800, which are the number on eleven. Those also being multiplied by twelve, will produce 479001600, which are the compleat number of *Changes* on twelve. And if twelve men should attempt to ring all those *Changes* on twelve Bells, they could not effect it in less than seventy five years, twelve Lunar Months, one week, and three days, notwithstanding they ring without intermission, and after the proportion of 720 *Changes* every hour. Or if one man should attempt to prick them down upon Paper, he could not effect it in less than the aforesaid space. And 1440 being prickt in a sheet, they would take up six hundred sixty five Reams of Paper, and upwards, reckoning five hundred Sheets to a Ream; which Paper at five shillings the Ream, would cost one hundred sixty six Pounds five Shillings,

The reason of the aforesaid Multiplication, by which the numbers of *Changes* are discovered, and also that those Products are the true numbers of *Changes*, will plainly and manifestly appear in these following Demonstrations.

But first, *two* must be admitted to be varied two ways, thus.—

	12
	21

And then consequently, *three* will make three times as many Changes as *two*; for there are three times two figures to be produced out of three, and not twice two the same figures, which are to be produced by casting away each of the three figures one after another. First, cast away 3, and 1.2 will remain; cast away 2, and 1.3 will remain; cast away 1, and 2.3 will remain. So that here are three times two figures produced out of the three, and not twice two the same figures, as 12. 13. 23. each two may be varied two ways, as before: then to the changes which each two makes add the third figure which is wanting; as to the two changes made by 1.2 add the 3, to the changes on 1.3 add the 2, and to the changes on 2.3 add the 1, and the three figures will stand six times together, and not twice alike, as here appeareth.

123
213
—
132
312
—
231
321
—

Four will make four times as many changes as *three*. For there are four times three figures to be had out of four, and not twice three the same figures, which are to be produced by casting away each of the four figures by turns. First cast away 4, and 123 will remain; cast away 3, and 124 will remain; cast away 2, and 134 will remain; and lastly, casting away 1, and 234 will remain; so that here is 123, 124, 134, 234, and not twice three the same figures. Now each three may be varied six ways, according to the preceding Example. Then to the six changes which each three makes, add the fourth figure which is wanting; as to the six changes on 123 add the 4, to the six changes on 124 add the 3, to the six changes on 134 add the 2, and to the six changes on 234 add the 1, which renders the changes compleat; for then the four figures stand twenty four times together, and not twice alike, as here appears.

Five will make five times as many changes as *four*; for there are five times four figures to be had out of five, and not twice four the same figures, which are to be produced as before, by casting away each of the five figures by turns. Cast away 5, and 1234 will remain; cast away way 4, and 1235 will remain; cast away 3, and 1245 will remain; cast away 2, and 1345 will remain; cast away 1, and 2345 will remain. So that here are five times four figures produced, and not twice four the same figures. Now each four may be varied twenty four ways, as in the preceding example; then to the twenty four changes which each four makes, add the fifth figure which is wanting: as to the twenty four changes on 1234, add the 5; to the twenty four changes on 1235, add the 4. to the changes on 1245, add 3. to the changes on 1345, add 2. and to the changes on 2345, add 1. which renders the changes compleat, for then the five figures stand sixscore times together, and not twice alike.

And in this manner the compleat numbers of changes on six, seven, eight, nine, ten, eleven, twelve, &c. may also be demonstrated.

The numbers of changes will also plainly appear by the methods, whereby they are commonly prickt and rung. Now the nature of these methods is such, that the changes on one number comprehends the changes on all lesser numbers, and that so regularly, that the compleat number of changes on each lesser number are made in a most exact method within the greater; insomuch that a compleat Peal of changes on one number seemeth to be formed by uniting of the compleat Peals on all lesser numbers into one entire body; which will manifestly appear in the 479001600 changes on twelve: for that Peal comprehends the 39916800 changes on eleven; these likewise comprehend the 3628800 changes on ten, these changes on ten comprehend the 362880 on nine, these on nine comprehend the 40320 on eight, these on eight comprehend the 5040 on seven, these likewise the 720 on six, the 720 also comprehend the 120 on five, the 120 comprehend the 24 changes on four, these also comprehend the six changes on three, and the six comprehend the two changes on two. Each of these Peals (*viz.*) on eleven, ten, nine, eight, seven, six, five, four, three, and two, being made in a most exact method within the changes on twelve. For Example, *two* are first admitted to be varied two ways, thus——

	12
	21

Now the figure 3 being hunted through each of those two changes, will produce the six changes on three. The term *Hunt*, is given to a Bell to express its motion in Ringing, which in figures is after this manner. It must lie behind, betwixt, and before the two figures: first behind them thus, 1 2 3; then betwixt them, thus, 1 3 2; now before them, thus, 3 1 2: this is called a *hunting* motion, and here it has hunted through the first change of the two, wherein it made three variations, as appears in the figures, standing thus in order.——

	123
	132
	312

Now it must hunt through the other change, which is 2 1, in the same manner as before; that is, first it must lie before, then betwixt the two figures, then behind them, thus, 321, 231, 213. Here it has hunted through again, wherein it made three more variations; which three being set directly under the former, the six variations will then plainly appear, as in these figures: where the three figures stand six times together, and not twice alike.

	123
	132
	312
	321
	231
	213

Now the figure 4 being in like manner hunted through each of those six changes, will produce the 24 changes on four. First, therefore it must hunt through the first, which is 123, letter (*a*), then through the second change of the six, which is 132, letter (*b*); then through the third, which is 312, letter (*c*), and so it being hunted through the rest of the changes likewise, will produce the twenty four changes on four.

(<i>c</i>)		3124
		3142
		3412
		4312
<hr/>		

The figure 5 being hunted through each of those twenty four changes, will produce the 120 changes on five, First therefore it must hunt through

the first, which is 1234, letter (a); then through the second, which is 1243, letter (b); then also through the third, which is 1423, letter (c). In which manner it being hunted through the rest of the twenty four changes, will produce the 120 on five. And then the figure 6 being hunted through each of those sixscore changes will produce the 720 changes on six. And the figure 7 being hunted through each of those 720 changes, will produce the 5040. In which manner also the eighth, ninth, tenth, eleventh, and twelfth, being successively hunted through each Peal in the aforesaid order, will at length produce the compleat number of changes on twelve. Wherein 'tis observable, that all the figures, except two, have a hunting motion; which two may properly be term'd the Center, about which the rest do circulate. By these methods it is evident, that every hunting figure hath a certain number of figures assigned, through which tis constantly to hunt: as in the aforesaid Example on twelve, where the 1.2 are assigned for the figure 3 to hunt through, as appears in the six changes before. And in like manner, 123 are assigned for the figure 4 to hunt through; 1234 are assigned for the figure 5 to hunt through; 12345 for 6 to hunt through, &c. Now the figure 3 hunts as many times through the 1.2. as those two make changes, that is, two times wherein it makes twice three changes, that is, six, as before appeareth. The figure 4 hunts as many times through the 123, as those three figures make changes, that is, six times; wherein it makes six times four changes, which amounts to twenty four. The figure 5 hunteth as many times through the 1234, as those four figures make changes, that is, twenty four times; wherein it makes twenty four times five changes, which amounts to 120. The figure 6 hunts as many times through the 12345, as those five make changes, that is 120 times, wherein it maketh 120 times six changes, which amounts to 720. And in like manner the figure 7 hunts 720 times through 123456, wherein it maketh 720 times seven changes, which amounts to 5040. The eighth hunteth 5040 times through 1234567, wherein it makes 40320 changes. The 9th hunteth 40320 times through 12345678, wherein it makes 362880 changes. The tenth hunteth 362880 times through 123456789, wherein it makes 3628800. The eleventh hunteth 3628800 times through 1.2.3.4.5.6.7.8.9.10. wherein it makes 39916800. And lastly, the twelfth hunteth 39916800 times through 1.2.3.4.5.6.7.8.9.10.11. wherein it makes 39916800 times twelve changes, which amounts to 479001600, being the compleat number on twelve. By which 'tis evident, that every hunting figure hunts as many times through its assigned number of figures,

as those figures are capable of making changes, which in short comprehends the summe and substance of this method, which is universal from two, to all greater numbers whatsoever.

If we consider the multitude of different words, wherewith we express our selves in Speech, it may be thought almost impossible that such numbers should arise out of twenty four Letters; yet this Art of variation will produce much more incredible effects. To give an instance thereof, I will shew the numbers of every quantity of Letters from two to twelve, that may be produced out of the Alphabet. The generality of Words consisting of these quantities, (*viz.*) two letters, three letters, four, five, six, seven, eight, nine, ten, eleven, and twelve letters. There are 10626 times four letters to be produced out of the twenty four letters of the Alphabet, and not twice four all the same Letters. There are likewise 42504 times five letters, 134596 times six letters, 346104 times seven, 735471 times eight, 1307504 times nine, 1961256 times ten, 2496144 times eleven, and 2704156 times twelve. Now each quantity being varied by the rules of this Art, will produce incredible numbers. First the 10626 times four letters, being multiplied by 24, which are the number of ways to vary each four letters, will produce

255024 that is to say, four letters may be produced out of the Alphabet to stand together after this manner (*a b c d*) two hundred fifty five thousand and twenty four times, and not twice alike. And in like manner, the 42504 times five Letters, being multiplied by 120, which are the number of ways to vary each five, will produce 5100480. The 134596 times six letters, being also multiplied by 720, will produce 96909120. The 346104, being multiplied by 5040, will produce 1744364160. The 735471, being multiplied by 40320, will produce 29654190720. The 1307504, being multiplied by 362880, will produce 474467051520. The 1961256, being multiplied by 3628800, will produce 7117005772800. The 2496144, being multiplied by 39916800, will produce 99638080819200. And lastly, the 2704156 time twelve letters, being multiplied by 479001600, will produce 1295295050649600, which products being all added together, as also 12696 which are the numbers consisting of two and three letters, the whole will amount to 1402556105125320, wherein there are not two alike, nor two letters of one sort in any one of them; which being written or printed on large Paper in *folio*, allowing 5000 to a sheet, they would take up 561022442 Reams of Paper and upwards, reckoning 500 sheets to a Ream: which Paper all the Houses in the City and Liberties of *London* would not contain; and in quantity doubtless infinitely exceeds all the Books that ever were printed in the world, reckoning only one of each Impression. And at the rate of five shillings the Ream, the Paper would cost 140255610.5 Pounds sterling; which is above four times as much as the yearly Rent of all the Lands and Houses in *England* amounts to. And all the people both young and old in the City and Suburbs of *London* (admitting they are five hundred thousand) could not speak the like numbers of words under forty years and upwards, each of them speaking 15000 every hour, and twelve hours every day. These prodigious numbers are the more to be admired, considering that the greatest number of letters in any of them, exceeds not twelve, neither are two letters of one sort in any one of them: but by producing and varying all the greater quantities, and placing two or more letters of one sort, or two of one sort and two of another, with all variety of the like nature that commonly happens in words, the numbers arising thereby would infinitely exceed the former; And if all the numbers of every quantity of letters from one to twenty four, together with all the variety as aforesaid, were methodically drawn out and varied according to the rules of this Art; which might easily be performed in respect of the plain and

practical method of doing it; but the infinite numbers of them would not permit a Million of men to effect it in some thousands of years: it would be evident, that there is no word or syllable in any language or speech in the world, which can be exprest with the character of our *Alphabet*, but might be found *literatim* and entire therein; and more by many thousands of Millions than can be pronounced, or that ever were yet made use of in any language.

I will here give one instance of another kind, shewing the admirable effects of this Art, and so conclude. A man having twenty Horses, contracts with a Brick-maker to give him one hundred pound Sterling; conditionally that the Brick-maker will deliver him as many Loads of Bricks, as there are several Teams of six Horses to be produced out of the aforesaid twenty to fetch them, and not one Team or Sett of six Horses to fetch two Loads. The Brick-maker might be thought to have made a very advantageous bargain, but the contrary will appear. For there are thirty eight thousand seven hundred and sixty several Teams of six Horses, to be produced out of twenty, and not twice six the same Horses; then the Brick-maker must deliver as many Loads as there are Teams, and each Load consisting of five hundred Bricks, the whole would amount to 19380000, which being bought for one hundred pounds as aforesaid, would not cost above five Farthings a thousand; and at the rate of thirteen shillings and four pence the thousand, they amount to twelve thousand nine hundred and twenty pounds Sterling. But should a contract be made with the Brick-maker to deliver as many Loads of Bricks, as there are Teams of six Horses in each, to be produced out of the aforesaid twenty, which shall stand in the Cart in a differing manner; that is to say, although there may be the same Horses in several Teams, yet their places shall be so changed, that they shall not stand twice alike in any two Teams. On this account the Brick-maker must deliver seven hundred and twenty times as many as before; for there are 38760 several Teams as before I have shewed: then each Team may be placed 720 ways in the Cart, and not twice alike, which is to be done according to the methods whereby the 720 changes on six Bells are rung. So that 38760, which are the number of Teams, multiplied by 720, which are the number of ways to vary the six Horses in each Team, the product will be 27907200, which are the compleat number of Teams; and every Team carrying one Load, consisting of five hundred Bricks, the Whole will amount to 13953600000 Bricks. And after the proportion of a hundred and fifty

thousand of Bricks to a House, they would build ninety three thousand and twenty four Houses; which are above six times as many as the late dreadful fire in *London* consumed. And at the rate of thirteen shillings and four pence the thousand, they are worth 6976800 pounds Sterling, which is at least four hundred Waggon-loads of money, as much as five Horses can ordinarily draw.

AN
INTRODUCTION
To the Practice of
RINGING

As the original design of casting Peals of Bells was in order to make pleasant Musick thereon; so the Notes in every Peal are formed apt for that end and purpose, every Peal of Bells being tun'd according to the principles of Musick; for in a Peal of six Bells are the six plain Song-Notes, whereupon all Musick consists, namely, *la sol fa mi re ut*. But in regard that in ringing of them the Notes cannot be had at command, as the Notes of other Instruments may; therefore, as the Practitioners in ancient time found some necessity to cause all the Notes to strike successively after one another, so likewise they thought fit in ringing them to place the Notes in this following order. The least note to lead or strike first, then the Note which is the next degree deeper or flatter, and so the rest of the notes to strike after each other according to their degrees, the flattest striking last; in which order the notes were successively reiterated both at fore-stroke and back-stroke, from the beginning to the end of each Peal. And at this day the same order is also observed in raising, ceasing, and ringing them at a low compass; wherein each note being confin'd to strike in a certain place, therefore had they their terms of First, Second, Third, Fourth, Fifth, &c. given them, to denote their order and places of striking; from whence also the Bells derive those terms of distinction by which they are now known. Although the ringing of a Peal of Bells in the aforesaid order, (which is commonly term'd *Round-ringing*) is in it self Musical; yet the Notes may be so placed in ringing, that their Musick may be rendred much more pleasant: for in Musick there are Concords, which indeed may be term'd the

very life and soul of it, that renders all Musick exceeding pleasant: the principal are Thirds, Fifths, and Eights; Thirds are 1 3. 2 4. and such like: Fifths are 1 5. 2 6. &c. Eights are 1 8. 2 9. 3 10. &c. each Concord consisting of two notes. They may well be termed Concords, in respect of their agreement and harmony; for the two notes (as if it were by mutual consent) being struck together at one instant, or else immediately after one another, affords delightful melody to the ear; in which respect, a peal of five Bells are capable of making better Musick than a peal of four; six better than five; and more especially will ten or twelve make more excellent Musick than any lesser numbers can possibly do, there being greater variety of Concords therein, and especially of Eights. For this Musical end were changes on Bells first practised, *changes* being nothing else but a moving and placing of the Notes in ringing, whereby variety of pleasant Musick is made; and as the manner of moving the notes, is, for two notes to change places with each other, therefore are they called *Changes*. The methods of changes being somewhat intricate, I have therefore penn'd the following Treatise as a Clue to guide the Practitioner through the Labirinth of them, wherein I have made use of figures to represent the notes of Bells, the manner thus. In a peal of five Bells there are five several notes, which with figures are thus exprest, 1 2 3 4 5: the figure 1 represents the least or sharpest note, which is term'd the First, because its place in round ringing is to lead; this note is most commonly called the *Treble*. The figure 2 represents the note which is the next degree deeper or flatter, and is term'd the Second, because it strikes in the second place. And in like manner 3 represents the note of the third Bell, 4 the note of the fourth Bell, and 5 the note of the Fifth or Tennor. In which manner, the figures in all the following methods do likewise represent the notes of Bells.

Since the ringing of changes requires the peal of Bells, on which the changes are to be rung, to be first raised up to a set Pull, which compass is most proper for the ringing of them; therefore the Learners first practice must be to raise a Bell true in peal, to ring it at a low compass, and also to cease it true in peal, wherein consists the chief grounds of this Art, which depends on the Ear, and therefore much judgment is required therein. And to speak the truth, most practitioners are in these days somewhat deficient herein; the ringing of changes having generally diverted the Learners fancy from the practice of *raising*, *round-ringing*, and *ceasing*, by which means we have in a manner lost one Excellency in the pursuit of another.

Therefore I could wish that the Practitioners of this Art would set a greater esteem on true Ringing in general, since the only excellency as well in the ringing of Changes as Rounds, depends thereon: the keeping of time being as essential to render all kinds of ringing pleasant to the ear, as 'tis to render any other kind of Musick; therefore the practitioner ought to have a Musical eare, and to have some judgment in beating time, without which he can never ring his Bell true in its place. A prospect of true ringing at any certain compass under the Sett, may thus be taken; for Instance, in ringing a peal of 5 Bells; from the fore-stroke of every note to the next fore-stroke of the same note, there ought to be eleven *punctums* or Beats of time, which are all supposed to stand at *Æquidistances*: now in ten of these *punctums*, the five notes ought exactly to strike at the fore-stroke and back-stroke, and the eleventh stands as a Cypher to guide the Treble-note at fore-stroke to a double proportion of time from the Tennor-note at back-stroke: which blank *punctum* must also be beaten in the same place by every note, to render its fore-stroke answerable to that of the Treble. For example; the third note having struck at fore-stroke, it must beat eleven *punctums* of equidistance unto its striking there again. The first *punctum* is that of the 4th note, the second 5, the third 1, the fourth 2, the fifth 3, the sixth 4, the seventh 5, the eighth 0, the ninth 1, the tenth 2, the eleventh its own place of striking again at fore-stroke. These *punctums* or Beats of time, must be proportioned either wider or closer, according to the compass of the Treble: therefore first the Treble must fix its compass certain and true at fore-stroke, which ought to be proportionate to what the number of the notes, and compass of the peal of Bells, may according to judgment permit; and then from one fore-stroke of it to the next, if there are five notes; there ought to be eleven *punctums* of equidistance assigned, wherein the notes should exactly strike (except the blank) as before. From hence 'tis, that the most judicious Ringer ought to be put to the Treble; for that bell cannot possibly be rung true by any other means than by beating of its own time; and although the exactness of true ringing requires the like in every note, when once the compass is fixed, yet the leading note being rung true, may be a guide to the rest of the notes, which may tolerably take their measures of time from the Treble-note: but for every note to take its measure of time solely from the next preceding note, must needs be very erronious; for thereby they implicitly lead one another out of the way. Or else in the ringing of five bells, from the fore-stroke of every note to the next fore-stroke of the same note, there may

be one and twenty *punctums* or beats of time assigned, to stand at equidistances; and the five notes, as they follow one another, at the fore-stroke and back-stroke to strike in every second *punctum*, except the Treble-note at fore-stroke, which must strike in the third *punctum* from the Tenor at back-stroke; so that then there will be two of those spaces betwixt every note, and three betwixt the note of the Tenor at back-stroke and the note of the Treble at fore-stroke, which possibly by some may be held a better compass than the former: but *quot homines tot sententiæ*. Every Practitioner, that has judgment to beat his own time, has the advantage of ringing his bell true, whilst the rest of the notes commit faults; for the compass being once fixed, as many bells as do either rise or fall from thence commit errors.

The truest way of raising a peal of bells according to the best of modern practice, is, as quick as may be; every Ringer taking assistance to raise his bell, according as the going of it requires. In raising of them, the lesser bells as the Treble &c. ought at the first pull to be swayed very deep, and held down in the sway by strength of armes as much as may be, to delay the time of their first striking, by which means the bigger bells, which carry a large compass, may have space to come in; and the raising of the smaller bells to be continued with a strong pull, giving them scope over head (for the aforesaid reason) untill they come up Frame-high, or thereabouts, and then the pull to be slacken'd, and the bells leisurely to be raised to the intended height or pitch. The bigger bells of the peal, as the Tenor &c. must in their first raising be checkt or pinch'd over head, by which means the notes of all the bells may be made to strike round in their due place and order from the beginning; and observe, that at the first pull all the bells must follow one another as close as may be. A peal of bells may thus be ceased: the falling of the bells from a Sett-pull must gradually be done, by checking them only at Sally, until the low compass renders the Sally useless; and when they are ceased so low, that they scarce strike at back-stroke for want of compass: then he that rings the Treble, may give notice (by stamping on the ground) that the next time the bells come to strike at the fore-stroke, they may be checkt down so low as to cease their striking at the back-stroke, yet their striking round at the fore-stroke may be continued, until they are brought into a chime, which is a graceful conclusion of a peal.

In raising of a peal of bells, all the notes ought to strike round at one pull: but mistake me not, I do not mean at the first pull; for at small bells 'tis usual to sway them all round at the first pull without striking; at the second pull to strike them at the fore-stroke, and at the third pull at back-stroke. In raising of a peal of more weighty bells, 'tis usual to strike them double at the fourth pull, because the extraordinary weight and large compass of the hind-bells permits it not to be done sooner. In the first raising of a peal of bells, one bell ought not to strike before the rest, or to miss striking when the rest go round: neither ought any bell in ceasing to strike after the rest, or to leave striking before the rest; all which, according to the strictness of true ringing, are accounted great faults.

The peal of bells on which the changes are to be rung, must first be raised up to a Sett-pull, which compass is most proper for the ringing of changes; for then the notes of the bells may be had at command. Therefore before the young Practitioner can be capable of ringing changes, he must be extraordinary well skill'd in the managing of a bell at a Sett-pull, which is absolutely requisite, for this reason: In the ringing of changes, his mind will be so busied and wholly taken up with the consideration of the course and method of them, and his eye continually wandring about to direct his pull in the following of the other bells; that unless he has extraordinary skill in the managing of his own bell, and can set it in a manner hood-winkt, he will be apt either to drop or overturn it; or else on the other hand, for want of skill, his eye and mind will be so fixed on his own rope and bell to guide the managing of it, that he cannot at the same time mind the course of the changes, and then no wonder if he is in a wood, which consequently follows; and indeed hence partly 'tis, that the Learners in their first practice do oftentimes toil and moil themselves to so little purpose. Therefore 'tis not enough that the young Practitioner can set a bell it may be half a score times together, when 'tis an even wager that he either drops or overturns it in those ten-pulls: but he must be so perfectly skill'd, as that he might adventure to lay ten to one, that he can set it thirty or forty times together, both fore-stroke and back-stroke, without dropping or overturning it, and without looking directly either on his hands or rope whilst he sets it. Therefore in his practice of setting a bell, he may cast his eye about on the other bell-ropes whilst he manageth his bell, whereby he may accustom himself to manage it as the ringing of changes requires.

The ringing of changes is performed, partly by the ear, and partly by the eye; the ear informs when to make a change, the eye directs the pull in the making of it, but then again the ear guides the striking of the note true in its place according to time. So that the ear and eye have each of them its proper object in the ringing of changes, and therefore ought at the same time to be absolutely free from all others whatsoever, the notes of the bells being the object of the ear, and the bell-ropes the object of the eye. Now these two Senses in the time of ringing do each of them thus perform its office. First, the ear, as a Sentinel, discovers the near approaching change, and also the place wherein his note lies, that is, whether before or behind the note wherewith 'tis to make a change, and gives present information to the eye, to perform its part accordingly in the making of it; but then again the eye refers it to the ear, to place the note true in striking. But questionless (by the bye) the truest ringing of changes is to be performed only by the ear; but then the Practitioners must be capable to judg of time, and to beat it true, which must be the only direction to guide their pull; and then it must be performed at a peal of bells that may be managed with ease: and being so fitted in all respects, the changes may doubtless be rung more true, with greater pleasure to the Practitioners, and much more free from mistakes and forgets, only by the ear, than by making use of the eye to direct their pull. But in regard that either the ill going of the bells, or want of fit accomplishments in the practitioners, may render it unfit for common practice; therefore the surest way is to ring both by the eye and ear, as I said before. Now to render the eye and ear rightly useful in the ringing of changes, five things ought by the young Practitioner to be well understood. First, he must be able to distinguish the notes of a peal of bells, and to know one from another in the time of ringing. Secondly, he must apprehend the places of the notes. Thirdly, the precedency of notes. Fourthly, the manner of making a change in ringing. Fifthly, a general prospect of the manner of putting the four preceding notions into practice.

Observation 1. The Learner must be able to distinguish the notes of a peal of bells one from another, and to know them asunder; as the Treble-note from the Second, the Second from the Third, &c. which, tis true, may readily be done in round ringing, because each note may be known by the place wherein it constantly strikes; but in ringing of changes it is more difficult. For admitting that six bells should strike in this order, 5.3.6.1.4.2. it might puzzle an unskilful ear to judg which is the Treble, or which the

Second note, especially whilst any other note strikes betwixt them: and the like difficulty might happen in distinguishing the rest of the notes, as the *2d* from the *3d*, &c. To remove this difficulty, he must endeavour to acquire some skill in tuning the notes of a peal of bells, with his voice, which he may do by imitating the notes of the bells when he hears them ring: or else any person that has skill in singing, will presently direct him therein, and also how to take the true pitch of any notes with his voice, which will be the only means to distinguish them asunder.

| 1 | 2 |

| 3 | 4 | 5 |

Observ. 2d. The Learner must rightly apprehend the places of the notes, which I think cannot better be done than by this means. Considering that the notes of a peal of bells do all strike one after another at the fore-

stroke, and the like at back-stroke; it might be requisite for him to imagine, that the notes in their striking do lie in a direct line, that is, in a row at the fore-stroke, and the like again at back-stroke; for then the places of the notes will much resemble the places of the figures wherewith the changes are prickt: for as the figures of every change do all stand in a row; so likewise the notes of the bells, being imagined to strike in the like row, he may the more readily apprehend the places of the notes, and consequently of changing them. For the practick part of this Art, is performed by means of imaginary, not real notions; which will thus manifestly appear. This is the platform of a Frame, wherein five bells may be supposed to hang in a Steeple, the figures therein representing the places wherein the five bells hang. Now in the sixscore changes on five bells, we will suppose the Treble to be the whole Hunt, and to hunt up first over the Second, then over the Third, &c. Now the Treble cannot really move out of the place wherein it hangs; but by delaying its striking untill the Second Bell has struck, it may by that means strike next after it; and again, by delaying its striking until the Third has struck; it may also strike next after that, this being the true manner of the changes; by which 'tis evident, that the bells have neither really such places nor motion as is pretended, but is meerly imaginary, and was at first feigned only as a Guide to direct the Practitioner's apprehension in the ringing of them. So that although the art of changes is in it self a real thing, yet the notions by which they are reduced to practice on bells, are not so. For which reason, the several practitioners of this Art, before they can become expert, are fain to form in their minds imaginary notions to guide them; some after one manner, some perhaps after another, according to their several fancies, yet all tending, to render the methods of changes practicable on bells; and having once form'd in their minds such imaginary helps, they become expert in short time: and then no sooner do they understand the methods of changes prickt with figures, which they commonly discover at first view; but they are presently capable of ringing them readily on bells, which experience daily testifies. And hence it is, that oftentimes the Learners, although they perfectly understand the methods of changes prickt, and also can perfectly manage a Bell; yet for want of a right apprehension of the nature of changing the notes, which of themselves it may be they cannot soon attain, are therefore much puzzled in their first practice of ringing changes. Therefore as a guide, the Learner must first form in his mind a fit representation of the places of the notes; which I think cannot

better be done, than by imagining each note to be a figure; as the Treble-note to be the figure 1, the second note the figure 2, the third note the figure 3, and the like of the rest. Then whensoever he hears a peal of bells ring, let him by strength of imagination conceit, that each note bears the shape of a figure; that is, at the same instant of time that the note strikes, he may imagine that it leaves the impression of the figure behind it, and that with the eye of his imagination he perfectly sees it: and likewise as the notes of the bells do all strike after one another at the fore-stroke, so he may imagine that they lie in a row in the shape of figures; and the like again at back-stroke. For instance: suppose that five Muskets were charged with five bullets, and that each bullet bears the shape of a figure; one Gun to be charged with the figure 1, another with the figure 2, and the other three Guns with these three figures, 3. 4. 5. Then supposing a straight line were drawn upon the wall, thus ————— and that the five Muskets were by five men levell'd against the line, which is to be the mark for them to shoot at; the figure 1 to be first shot off, then the figure 2, and so the rest in order immediately after one another: now at the same instant of time that the Guns are heard to go off, the five figures would appear in a

row upon the wall, thus.  So in like manner when he hears a peal of five bells strike after one another at the fore-stroke, and again at back-stroke, he may imagine that at the very instant of their striking their notes appear to his apprehension in the shape of the five figures, and that they strike in a row, thus, 1 2 3 4 5, as if each Bell were a Gun, and had shot out its note in the shape of a figure. There being necessity that the young Practitioner must either imagine each note to be a real figure, or else a representative: for as the ear is to be his guide to direct when to make each change; so a right apprehension of the motion and places of the notes, must be a means to guide his ear. Now in regard that the changes are first prickt with figures, from whence the notes of the bells derive their course, therefore if in ringing he imagine each note to be a real figure, then the same knowledge that guides the pricking, guides also as readily the ringing of them, for then the note of his bell is supposed to have the same course with that of a real figure. But if he imagines that each note is not a real, but a representative of a figure; then consequently it must only have the like, and not the same course: by which means, whilst he is ringing of changes, his mind must have frequent recourse to his Pocket, that is, to

the changes there prickt; from whence he must continually fetch instructions to direct the course of his Bell, which is oftentimes the case of the Learner: his thoughts in the time of ringing being commonly upon the figures that are prickt, either upon paper, or else upon the Steeple-wall, whilst it should be wholly intent upon the notes. Therefore in a word, the Practitioner whilst he is ringing of changes, must fix his mind fully and wholly upon the notes of the bells, and not permit it in the least to wander from thence; for the notes are to be the sole object of the thoughts in the time of ringing.

The notes being imagined to strike in a row as aforesaid, their places will then soon be understood. The notes do take their places according to their successive order of striking both at fore-stroke and back-stroke; each succeeding note taking its place next to that which preceds it: for whatsoever bell leads either at fore-stroke or at back-stroke, its note lieth in the first place of the supposed row of notes; and that which strikes next after the leading note, its note lieth in the second place of the supposed row of notes, and so the rest in the like order. As if five bells should strike thus after one another either of fore-stroke or back-stroke, 5 4 1 2 3. here the *5th* lieth in the first place, because it was first struck; the *4th* in the second place, because it was second struck; the Treble in the third place, because it was third struck; the *2d* in the fourth place, because it was fourth struck; and the *3d* in the last place, because it was last struck; and the like of the notes in every change.

Observ. 3. The next thing to be understood by the Learner, is the precedence of the notes. Now whereas in the ringing of changes, the notes do all strike after one another at the fore-stroke, and again at the back-stroke, therefore are they said to lie before or behind each other, according to their places of striking. As if five men were standing in a row, as these five figures represent, 1 2 3 4 5, the first man to stand at the fig. 1, the second man at the figure 2, &c. and that they stand with their faces all one way, that is, the first man ready to lead, and the rest to follow him one behind another. Now the first man stands before the rest, and the fifth man behind the rest; the second man stands behind the first man, but before the third; the third man stands behind the second, but before the fourth; and the fourth stands behind the third, but before the fifth. In which manner the notes being supposed to strike in the like row, may also be laid to lie before or behind each other as the men did. For whatsoever note leads either at

fore-stroke or back-stroke, is said to lie before the rest; and that which strikes last, to strike behind the rest. The note which lieth in the second place, as on the one hand it lieth behind the leading note, so on the other hand it lieth before the note in the third place. As the note in the third place lieth behind the note in the second place, so it lieth before the note in the fourth place. And in like manner, every note is said to lie behind those that strike before it, and before those that strike after it.

Observ. 4. A Change is to be made betwixt two notes, by moving them into each others places; wherein 'tis to be observed as a general Rule, That every change must be made betwixt two notes that strike next to each other. As if five bells were ringing round in this order, 12345, the 1 and 2 may make a change, or 2 and 3, or likewise 3 and 4, or 4 and 5, because each two lie next each other; but the 1 and 3 cannot, because 2 strikes between them, much less may 1 and 4, &c. The two notes which make every change, moves into each others places in the making of it; wherein one note is said to move *up*, and the other *down*. The reason why one of them is said to move up, is, because he that rings that bell, in the making of the change must hold it up at the Sett a little longer than ordinary, to delay its striking, whereby 'tis made to follow the other note which before it preceded; and because 'tis so held up, therefore 'tis said to make an *Up-change*, or to move up: and on the contrary, the reason why the other note is said to move down, is, because he that rings it, pulls down the bell a little sooner than ordinary, to make it strike before the note which before it followed; and because 'tis so pulled down, therefore it is said to make a *Down-change*, or to move down. I will here give a short though certain rule to know when an Up-change or a Down-change is to be made: whensoever any note moves to strike behind the note wherewith it makes a change, it makes an up-change in doing it; and whensoever it moves to strike before the note, which 'tis to make a change with, it makes a down-change in doing it: so that every note which moves fromward the leading-note, makes an up-change; and when it moves toward the leading-note, it makes a down-change. I will here shew the manner of making a change: admitting that a peal of five bells were raised to a sett-pull, which is the usual compass for ringing of changes; the notes are first supposed to strike in this order, 12345. Now a change may be made betwixt any two notes that strike next each other; I will here make it betwixt the 3d. and 4th. which is to be done by moving them into each others' places. Now 'tis observable, that before the making of the change,

the 3d. note lies before the 4th. that is, it strikes next before the 4th; and the 4th. lies behind the 3d. that is, it strikes behind it: now in the making of the change, the 3d. must move to strike behind the 4th: wherein it makes an up-change; and the 4th. note at the same time must move to strike before the 3d. wherein it makes a down-change; the change being made, the bells will strike thus, 12435. All changes whatsoever are made in the aforesaid manner: for as the 3d note made an up-change in moving to strike behind the 4th, and the 4th at the same time a down-change in moving to strike before the 3d; so in like manner the two notes that make every change, must in the making of it move the one up, and the other down, as the 3d and 4th here has done. The Learner may take notice, that in ringing termes 'tis not usual to say, that a bell makes an up-change, or a down-change; but in short, that it *moves up* or *down*, which implies the former. When a note makes an up-change, 'tis then said to move *over* the other note; and when it makes a down-change, to move *under* it: as in the next preceding example, where the 3d note is said to move up over the 4th, and the 4th down under the 3d, in which manner the terms *over* and *under* are given to the two notes that make every change.

Observ. 5. In the time of ringing changes, two things are by the Practitioners to be well considered. First, to observe and readily to know, which two bells are always to make the next succeeding change: Secondly, if he is concern'd therein, to consider what bell he is to follow in the making of it. Upon a right knowledge of these two things, depends the Practick part of this Art. To make him expert herein, he must before hand perfectly understand, and readily remember the course and method of the changes prickt with figures, wherein he ought to be so well skill'd, as to be able to prick them down divers ways, that is, to make any figure a Hunt at pleasure; which when he can readily and speedily do, without pausing to consider of the course, then 'tis presumed that he understands the methods thoroughly. But yet he will not be capable to put them in practice, untill he understands the manner of making a change in ringing; neither can he understand that, until he understands the precedency of the notes; nor the precedency, until he understands the places; nor the places, until he knows the notes one from another. Therefore the four preceding observations being first perfectly understood, and also the methods of the changes as before; the Practitioner may then successfully proceed in the ringing of changes; and as a further help therein I will here instruct him. There are three bells

concern'd in the making of every single change, except only when 'tis made behind, and then but two: whensoever the note of his bell is to make a change with any other note, his ear must then inform him whether it lies before or behind the other note; if it lies before, then in making the change it must move up behind it, that is, to follow it; and consequently, he must draw down his bell next after that which he makes a change with, which is called an up-change, as I said before. But if the note of his bell lies behind the other, then in making of the change it must move down to strike before it, and consequently he must draw down his bell next after that which the other before followed, this being a down-change. So that the making of an up-change is very easie, because he must always follow that bell which he makes a change with; but a down-change is more difficult, because he cannot so readily apprehend what bell he is to follow; yet there is a certain rule for it, which is this: to observe beforehand what note strikes the next but one before his, which bell he must follow in the making of the change. Whensoever the two notes, which strike next before his note, are to make a change; he must consider, that notwithstanding his note is to lie still in its place, yet he is concern'd therein, because the bell which he followed before the making of the change, must in the making of it move away down, and therefore he must follow the bell that comes into its place.

The changes are to be rung, either by *walking* them, as the term is; or else Whole-pulls, or Half-pulls. By *walking* them, is meant, that the bells go round four, six, eight times or more in one change; which way is very proper for young Practitioners, to introduce them into a more ready way of Practice; for whilst the bells go round divers times in one change, they have in the mean time leisure to consider which two bells are to make the next following change, and also what bell each of them is to follow in the making of it; and so by diligence in practice they will by degrees acquire a more ready skill to enable them to ring at whole-pulls. Whole-pulls, is, when the bells go round at the fore-stroke and back-stroke in a change; and every time they are pull'd down at Sally, a new change is made. Whole-pulls was the general practice in former times; and indeed, considering the manner of the hanging of the bells in those days, they could not well be rung at half-pulls: but since the improvement of the Art of Bell-hanging, that is, with round Wheels, trussing them up in the Stock, and placing the Roll at right Angles with the Sole of the Wheel; the bells go much better, and are managed with more ease at a Sett-pull than formerly: therefore the

changes are now generally rung at half-pulls, that is, at the fore-stroke one change, at the back-stroke another, and so throughout.

In ringing half-pulls, some peals of changes will cut compass, wherein the whole Hunt comes always to lead at the back-stroke; to prevent which, make the first change of the peal at the back-stroke. In plain and single changes on six bells, to hunt (that is, whole Hunt) the Treble, third, or fifth, down at the beginning of a peal cuts compass, unless prevented as before. Also to hunt the second, fourth, or sixth up at the beginning of a peal, cuts compass, unless prevented as before. Which rules, leaving out the Tenor, serves in like manner to prevent cutting compass on five bells.

'Tis convenient in ringing, to give notice of the extream changes, and he that rings the slowest Hunt, may best do it. The manner of it is, to say *Extream*, when the leading bell is pulling down, in order to make the change next before the extream; by which means there will be one compleat change betwixt the warning and the extream: longer warning would be too much, and shorter too little.

The divers kinds of changes on Bells may be comprehended under two heads, viz. Plain Changes, and Cross Peals, which terms are comparatively given: for as the first are plain and easie only in comparison to the methods of the second; so consequently the second cross and intricate in comparison to the methods of the first. I will first shew in what respect they differ, and then proceed to the methods. Plain changes (I mean compleat peals) are such as have one universal method, wherein all the notes except three have a direct hunting course, moving gradually under each other in one plain and uniform order. But the methods of cross peals are various, each peal having a course differing from all others: and although most of them have Hunts, yet the Hunts have different kinds of motions, and some very intricate. Moreover plain changes are also term'd Single changes, because in the ringing of them there is only a single change made in the striking of all the notes once round either at fore-stroke or back-stroke; whereas in cross changes 'tis usual to make as many changes as the number of notes will permit. For example, supposing that a peal of 5 bells were raised, and rung at a Sett-pull; the notes are supposed to strike round in this order, 12345: now any two of the notes that strike next together may make a change, therefore either a single or a double change may be made at pleasure. The single change is made by changing only two notes; the double change is

made by changing four notes, that is, two to make one change and two another, yet 'tis called one double change, and not two changes, in regard 'tis made in the striking of the five notes of the bells once round: as, admit the treble, second, third, and fourth, should make a change, 'tis thus to be done, 21435, where the Treble and Second made one change, and 3, 4 another; which we will imagine to be made at the fore-stroke of the bells, and therefore 'tis called one double change, and not two changes, because 'tis entirely made in the striking of the five notes once round. So that this one double change has effected that which would have required two single changes to have done the like. For instance, there can but two notes change their places at once in a single change, therefore the Treble and Second shall first change their places thus, 21345; then the third and fourth thus, 21435: so that here the five notes have gone twice round to effect that, which in the double change was done in going once round. And this is the nature of the difference between Plain and Cross changes.

As the Learner ought to proceed regularly in his practice, beginning first with the plainest and easiest methods. I will therefore observe that order, and first shew the course and methods of Plain changes.

The Changes on two Bells.

Two bells are capable to make only two changes, which is to be done by changing the notes twice, as in these figures.——

	<u>1 2</u>
	2 1
	1 2

The Changes on three Bells.

There are six changes on three bells; which are made by this rule: the two first and two last notes must be changed by turns.

	<u>123</u>
First the two first notes, which are 1 2 thus.	213
The two last, which are 1 3, thus.	231
The two first	321
The two last	312
The two first	132
The two last	123

In these six changes 'tis observable, that the two first notes, which were 1 2, made the first change of the six; but they may as well be rung by

	<u>123</u>
beginning with the two last notes, which are 2, 3 thus——	132
Next the two first notes, which are 1 3, thus,	312
The two last	321
The two first	231
The two last	213
The two first	123

The six changes can be rung no more than these two ways here set down.

The Six changes are sometimes rung by observing a hunt therein, which is very improper, since every note has a like course. Yet I confess in demonstrating the methods on twelve, I did there admit a Hunt into the six changes; but that was only for demonstration sake.

The compleat peals of plain changes, from three to all greater numbers whatsoever, as the Twenty four changes on four, the Sixscore on five, the Seven hundred and twenty on six, &c. are prickt and rung by one method; all the notes having a hunting-motion, except only three in each peal, which three do make the six changes in the same manner as they are before prickt.

So that the Six changes on three may be term'd the *basis* or foundation of the compleat peals on all greater numbers.

Every Hunting note in each peal has a certain number of notes assigned, through which 'tis always to hunt. The term *hunt* is given to a note in respect of the manner of its motion, which I will shew in this example. First, the notes of four bells are supposed to strike round in this order, 1234. The Treble shall be the Hunt, and the other three assigned or appointed for it to hunt through. Now whereas the Treble-note leads, it must move through its assigned number to strike behind them: and whereas every change must be made betwixt two notes that strike next each other, as I have shewed before in the *4th Observation*; therefore the hunting-note is confin'd to move gradually through the rest by making a change with each note that strikes next to it; and accordingly it must first move into the *2d* place, next into the *3d* place, and lastly into the *4th*. So that 'tis to make a change with every note that lies behind it; first with the *2d* note, next with the *3d*, and lastly with the *4th*.

	<u>1234</u>
The first change is thus	2134
The second thus	2314
The third thus	2341

The hunting note has here moved through its assigned number; for whereas at first it did lead, now it strikes behind them. Wherein 'tis observable, that it made up changes all the way; which of necessity it must do, because every note with which it was to make a change, lay behind it: and because it made up changes, therefore 'tis said to have hunted up. The hunting-note shall now move through its assigned number again, to lead as at first. Therefore first it must move into the *3d* place, then into the second place, and lastly into the first place, which is called the Treble's place; in which motion it must make a change with each note that strikes next before it: first with the *4th* note, next with the *3d*, then with the *2d*.

The first change thus	2314
The second thus	2134
The third thus	1234

'Tis observable, that here the Treble made down-changes all the way, which of necessity it must do, because every note with which it was to

make a change, lay before it: and because it made down-changes, therefore it is said to have hunted down. This is the manner of the motion of the hunting notes in all peals of plain changes; for they hunt up and down through their assigned number, as the 1 here has done. This example is plain and full to instruct the Learner in the hunting of any bell, therefore he ought to peruse it diligently, that he may understand the true scope and meaning of it; and as a help he may apply himself to practice by taking a Treble, and attempt to hunt it up and down as this Example directs; which he may the more readily do, if he understand the *5th Observation* before set down, which guides him to make a change in ringing. So that partly by reading and well considering of what I have here wrote, and partly by practice, he may in a short time become perfect in the hunting motion of any note; which when he rightly apprehends, he will then presently be capable of understanding the following methods; and therefore I shall be the more brief in my directions to them.

The Changes on four Bells.

Twenty four changes may be rung upon four bells: but the Learner may first practice the twelve changes, and the eighteen changes. In the twelve changes the notes are all to be hunted up after one another, which may be called the Twelve all over. First the treble-note must be hunted up, letter (*a*); then the second note must likewise hunt up, letter (*b*); next the third note must hunt up, letter (*c*); and lastly the 4th note also, letter (*d*).

	<u>1234</u>
	2134
<i>a</i>	2314
	2341
	3241
<i>b</i>	3421
	3412
	4312
<i>c</i>	4132
	4123
	1423
<i>d</i>	1243
	1234

The four notes may also hunt down one after another. First, the 4th note must hunt down to lead: then the 3^d note likewise, and so the 2^d and Treble one after another, which may be term'd the Twelve all under.

Courteous Reader, in my directions to the course of each peal, I do there refer by letters to the examples; which I am forced to do, to prevent those confused breaks, and unhandsome spaces, which otherwise would have happen'd both in examples and precepts. Whatever letter I mention in my directions, refers to the like at the figures. For instance; in my directions to the twelve changes next before, I there directed the treble-note to be first hunted up, letter (*a*); which letter refers to the like letter at the first three changes of the twelve, where the Treble hunted up, as 'tis here again represented, and the like of the rest.

	2134
<i>a</i>	2314
	2341

In the Eighteen changes, the Treble is a hunting note, but never hunts up farther than the *3d* place; and when it lies there, the two first notes must make a change; and every time it leads, the two hindmost notes. First it hunts up into the *3d* place, letter (*a*); the two first notes, Which are 2.3, make a change, letter (*b*); the Treble hunts down (*c*). The two hindmost notes make a change (*d*), the Treble hunts up (*e*). The two first notes, which are 3.4, make a change (*f*) the Treble hunts down (*g*); the two last notes, which are 3.2, make a change (*h*), which method being continued, will bring the bells round at the end of eighteen changes. The Eighteen changes may also be rung by hunting the *4th* note down into the *2d* place, and then a change to be made behind: the *4th* note to be hunted up again into its own place, and then a change to be made before, which course being continued, will produce Eighteen changes.

<i>k</i>	2413
<i>l</i>	2143 1243
<i>m</i>	1234

The Six changes on three are the ground of the Twenty four changes on four; for one of the four notes hath a constant hunting motion through the other three, in the same manner as in the preceding Example, [page 50](#). and the three notes are to make the six changes in the same manner as I have before shewed in the changes on three bells; one of the six changes being always made every time the hunt lies either before or behind the three bells: therefore if the Learner do but rightly apprehend the course of the six changes, and also the manner of the motion of the hunting note, he will presently understand the method of the twenty four changes. The six changes in the twenty four, according to the terms of ringing are called Extream changes, and the three bells which makes them, Extream bells. So that in the twenty four changes, there is a hunt and three extream bells. Every time the hunt lies either before or behind the extream bells, an extream change must then be made. The extream changes may be made two ways, viz. either betwixt the two farthest extream bells from the hunt, or else betwixt the two nearest extream bells to it. In this Example every

extream change shall be made betwixt the two farthest extream bells from the hunt, and the treble shall be the hunting note, which must first hunt up (*a*); then the two farthest notes from the hunt, which are 2.3, must make an extream change (*b*). The Treble must hunt down (*c*). The two farthest notes from the hunt, which are 2.4, must make an extream change (*d*). The treble must hunt up (*e*); the two farthest notes from the hunt, which are 3.4, must make an extream change (*f*). The treble-note must hunt down (*g*). The two farthest extream bells from the hunt, which are 3.2, must make an extream change (*h*). The treble must hunt up (*i*). The two farthest notes from the hunt, which are 4.2, must make an extream change (*k*). The treble must hunt down (*l*). The two farthest extream bells, which are 4.3, must make an extream change (*m*), which concludes the peal. Now the Learner for his satisfaction may take out the extream changes in the same order as they were made, as first at (*b*), then (*d*), and so (*f.h.k.m.*) and they will stand as they are here set down; where 'tis evident, that 2.3.4 have made the six changes according to the method of the first six changes on three bells, before set down, ([page 48.](#)) where the first change of that six was 213, and this being 324, is the same in course though the figures differ, and the rest of the changes in this six, are likewise the same in course and method with those.

 1234

In the preceding twenty four changes, every extream change was made betwixt the two furthest extream bells from the hunt. I will therefore here set down an example, where they shall be made between the two nearest bells, to it. First, the treble hunts up (*a*). The two next notes to the hunt, which are 3.4, must make an extream change (*b*). The Treble must hunt down (*c*). The two nearest notes to the hunt, which are 2.4, must make an extream change (*d*). The Treble hunts up (*e*). The two nearest extream bells to the hunt, which are 2.3, must make an extream change (*f*). The Treble hunts down (*g*). The two next extream bells to the hunt, which are 4.3, must make a change (*h*). And the like extream changes being made as at (*k*) and (*m*), concludes the peal.

The six extream changes, viz. (*b.d.f.h.k.* and *m.*) being set down by themselves, will stand in this order, as here you see; where 'tis plain, that 2 3 4 have made the six changes, according to the method of the last six changes on three bells, *page* [49](#). where the first change of that six is made between the last two notes thus, 1 3 2. So in like manner is the first here thus, 243, which is the same method with that, though not the same figures.

2431
1423

4321
1342
3241
1234

So that the making of the extream changes two ways in the twenty four, proceeds from the two ways of making the six changes on three bells. This last way of making the extream changes, may, for distinction from the other way, be called *mediums*; which term is very proper, in regard that the two middlemost of the four notes do always make the extream change. The extream changes in one peal must all be made alike, that is, either betwixt the two farthest notes from the hunt, or else betwixt the two nearest notes to it; but the most usual way is to make them between the two farthest.

Any note may be made a hunt at pleasure, and its first motion at the beginning of the peal may be either up or down. The twenty four changes may be rung sixteen ways according to the aforesaid method, yet the changes to each are still one and the same; but by making each note a hunt, and moving it either up or down at the beginning, and also by making the extream changes two ways, the course of the changes will be so altered, that the same changes shall not come all along together in any two of those sixteen ways. With the hunting of one note it may be rung four ways; for the note may move either up or down at the beginning of the peal; then in its motion either way the extream changes maybe made two ways, as before: so that to make each note a hunt, and with each hunt to ring it four ways makes sixteen in the whole. Wherein 'tis observable, that the treble-note cannot be moved down at first, nor the *4th* up; therefore an extream change must first be made, which is as effectual as if either note had moved at first. I have here prickt the twenty four changes three ways, wherein the extream changes are all made betwixt the two farthest notes from the hunt.

The Changes on five Bells.

There are sixscore changes to be rung on five bells; but the Learner may first practice some shorter peals, as the Ten changes, the twelve, the Fourteen, the Twenty all over, the Twenty with one hunt, and the Forty eight.

In the Ten changes the treble must first hunt up (*a*); the 2.3 must make a change (*b*). The treble must hunt down again (*c*); the 3.2 must make another change (*d*). The ten changes may also be rung by hunting down the 5 to lead; then 3.4 to make a change; the 5 to be hunted up again, and the 4.3 to make another change.

	12345

<i>b</i>	32451
	32415
<i>c</i>	32145
	31245
	13245
<i>d</i>	12345

In the Twelve changes the treble hunts up into the third place, then the two first notes make a change; the treble hunts down again, then the two hindmost notes make a change. First the treble hunts into the 3^d place (*a*); the two first notes 2.3 make a change (*b*). The treble hunts down (*c*); the two last notes make a change (*d*); the treble hunts up (*e*); the two first notes make a change (*f*); the treble hunts down (*g*); the two last notes make another change (*h*).

	12345

<i>f</i>	23154
<i>g</i>	21354 12354
<i>h</i>	12345

In the Fourteen changes, the treble first hunts up behind; then the 5 hunts down to lead; the treble then hunts down again into its own place; and the fifth also hunts up into its own place.

The Twenty all over are rung in the same manner as the Twelve all over upon four bells, to which I refer.

In the Twenty changes with one hunt, the hunting note continually hunts up and down through the other notes, and every time it lies either before or behind them, an extream change must be made betwixt the two farthest notes from it. The treble shall be the hunt, and first hunteth up (*a*). An extream change is made (*b*); the treble hunts down (*c*); an extream change is made (*d*); which course must be continued to the end. The extream changes may also be made betwixt the two next notes to the hunt. Any note may be made a hunt at pleasure, yet still observing to make the extreams as before.

	13245
<i>d</i>	13254

In the forty eight changes, the 5th and 4th are both hunts, and 1 2 3 do make the six changes; the 5.4 do hunt down by turns, and when either of them leads, then one of the six changes is made. First the 5 hunts down (*a*); one of the six changes is made (*b*); the 5 hunts up into its own place (*c*); the 4 hunts down (*d*); another of the six changes is made (*e*); then the 4 must hunt up, and the 5 down again, &c. which course must be continued to the end.

<i>e</i>	42315

In the Sixscore changes, four of the notes do make the Twenty four changes, and the fifth note hunts continually through them: so that the

course and method of the Sixscore is in effect the same with that of the Four and twenty. For as the Four and twenty comprehend the Six changes on three; so in like manner the Sixscore comprehend the Four and twenty changes on four, and the Six changes on three. Therefore in the Sixscore there must be two hunts and three extream bells; one of the hunts is term'd the whole-hunt, and the other the half-hunt, The three extream bells do make the Six changes in the same manner as they were made before in the Four and twenty changes upon four bells, and are here also call'd Extream changes: the half-hunt and three extream bells do make the Four and twenty changes in the same manner as the Four and twenty changes on four bells were likewise made: and the whole hunt continually hunts through those four bells, and every time it either leads or lies behind them, one change must then be made in the twenty four. 1 shall here be the whole-hunt, 2 the half-hunt, and 345 extream bells: so that 2345 must make the four and twenty changes. Every extream change shall be made betwixt the two farthest extream bells from the half-hunt. First, the treble hunts up (*a*). One of the twenty four changes must now be made; and therefore 2 which is the hunt in the twenty four, must begin its motion through the extream bells (*b*). The treble hunts down (*c*); the half-hunt must proceed in its course (*d*); the whole-hunt hunts up (*e*); The half-hunt proceeds forward (*f*); the whole-hunt moves down (*g*). The half-hunt should now proceed, but having finished its course through the extream bells, therefore an extream change must now be made betwixt the two farthest extream bells from it, which are 3.4 (*h*). The treble must hunt up (*i*); the half-hunt must now begin its course again through the extream bells (*k*); treble hunts down (*l*); the half-hunt proceeds in its course down (*m*); treble hunts up (*n*); the half-hunt proceeds in its course down (*o*); treble hunts down (*p*); the half-hunt having finished its course, therefore an extream change must be made betwixt the two farthest extream bells from it, which are 3.5 (*q*). The treble hunts up (*r*). The half-hunt begins its motion again through the extream bells, and first it moves up over 4th (*s*). The whole hunt moves down (*t*); the half-hunt must proceed in its course, and therefore must move over another note (*v*). And this method being observed, will produce sixscore changes, and then the bells will in course come round. Now 'tis observable, that the changes at (*b d f h k m o q s v x* and *z*), being set down by themselves, that is, the 1 to be excluded, and the changes on 2345 to be set directly under one another in the same successive order as they were made, it will thereby appear, that those four

figures have made twelve changes of the twenty four, according to the method of the first twenty four changes on four bells before set down. And whereas here are just half the sixscore changes prickt down, so likewise here are just half the four and twenty changes made therein: and the remaining part of this sixscore being likewise prickt, the remaining part of this four and twenty would also appear therein, which part being added to the former twelve, would make up the twenty four changes compleat; and the method of them the same in all respects with the first twenty four changes on four bells, *page*.

Any note may be made a whole hunt at pleasure, and its first motion at the beginning of the peal may either be up or down. Any note may also be made a half-hunt, and its first motion likewise up or down at pleasure; yet still observing that the half-hunt and three extream bells must make the twenty four changes, as in this last example. So that in the sixscore changes the Learner may observe, that the three extream bells are always assigned for the half-hunt to hunt through; and the half-hunt and three extream bells

are also assigned for the whole-hunt to hunt through: so that the whole-hunt always hunts through four notes, and the half-hunt through three. The extream changes may be made two ways; first, betwixt the two farthest extream bells from the half-hunt, as in this last example; secondly, betwixt the two next extream bells to the half-hunt, which may be called *mediums*, for distinction from the former. But the most usual and easiest way, is to make them betwixt the two farthest notes from the half-hunt.

Whereas the treble or fifth being made whole-hunts, the first of them can neither be moved down, nor the last up, at the beginning of a peal; therefore one of the twenty four changes must first be made, which is as effectual, as if the treble had moved down, or the 5th up.

The Learner may observe, that two of the four and twenty changes are never made together in any sixscore, but as soon as one is made, the whole-hunt moves through the four notes before another can be made.

The sixscore changes may be rung one hundred and sixty ways, which are thus demonstrable. There are five times four figures to be produced out of five, and not twice four the same figures: as 1234. 1235. 1245. 1345. 2345. with each four the twenty four changes may be prickd sixteen ways, as before I have shewed on four bells; so that here will be five times sixteen four and twenties, which amount to eighty, and not two alike. Now to each four add the fifth figure which is wanting, as to 1234 add 5, to 1235 add 4, to 1245 add 3, to 1345 add 2, to 2345 add 1, and every fifth figure being hunted through the sixteen four and twenties, which the other four make, as the 5 through the sixteen four and twenties which the 1234 make, and the like of the rest, will produce as many sixscores as there were four and twenties, that is, 80. Then the whole hunt may hunt two ways through each four and twenty, that is, up and down at the beginning, which doubles the former number, and makes 160 in the whole.

Treble up, fifth down.

In ringing terms the hunts are named in short, as in the peals here prick't. The first which is named is here understood to be the whole-hunt, and the last the half-hunt. For instance, Treble is the whole-hunt, and fifth the half-hunt; and treble is the whole-hunt, and fourth the half-hunt, &c.

The Changes on six Bells.

There are seven hundred and twenty changes to be rung of six bells. But the Learner may first practice some shorter peals.

The twenty four changes are thus rung. The treble must continually hunt through the rest of the notes, and every time it leads or lies behind them, an extream change must then be made between the two farthest notes from it. The treble hunts up (*a*). A change is made betwixt the two farthest notes from it, which are 2.3 (*b*). The treble hunts down (*c*). An extream change is made betwixt 5.6 (*d*), which method must be continued to the end. Any note may be made a hunt at pleasure, and the extream changes may as well be made betwixt the two nearest notes to the hunt. The Thirty-all-over are rung according to the method of the Twelve all over upon four bells, to which I refer.

<i>d</i>	132465

The thirty six changes are thus rung. The treble hunts up into the third place, and then the two first notes make a change. The treble hunts down again to lead, and then the two notes in the 3^d and 4th places do make a change, except the 2 lies next the treble, and then the two hindmost notes. The treble hunts up (*a*). The two first notes make a change (*b*). The treble hunts down (*c*); the 2.4 make a change (*d*). In which manner the changes

are to be made untill the treble leads, and the 2 (which may be term'd the half-hunt) lies next it, and then the extream change is made behind, as in the last change of this example, there being but two of these changes in the peal.

In the Twelvescore long-hunts, (otherwise called the *Esquire's twelvescore*); the 6th and 5th are hunts, and 1234 do make the twenty four changes. The 6th and 5th do hunt down by turns, and when either of them leads, one of the twenty four changes must then be made. The course and method of this is the same with that of the forty eight changes on five bells, to which I refer the Learner.

In the Sevenscore and four, the treble and tenor are both hunts; and 2345 do make the twenty four changes, 2 being the hunt therein. The treble and tenor do both hunt at one and the same time, the one up, and the other down, crossing each others course; and when one of them leads, the other

always lies behind; at which time one of the twenty four changes must be made. The extream changes in this peal are made in the same manner as before I have shewed upon four bells. The treble hunts up, and the tenor down (*a*). One of the twenty four changes is made (*b*). The treble hunts down, and the tenor up (*c*). Another of the twenty four changes is made (*d*). The treble hunts up, and the tenor down (*e*), &c. which method must be observed to the end.

In the sixscore changes there is a whole-hunt, a half-hunt, and four extream bells. The half-hunt and four extream bells do make the twenty changes in the same manner as the twenty changes were made upon five bells with one hunt. [page 61](#). The whole hunt hath a continual motion through the other five notes, and every time it leads and lies behind them, one of the twenty changes must then be made. In this example, treble is the whole-hunt, 2 the half-hunt, and 3456 extream bells; therefore 23456 must make the twenty changes wherein 2 is the hunt, and every time it lies either

before the four extream bells, or behind them, an extream change must then be made, which here shall be betwixt the two farthest extream bells from the half-hunt. The treble hunts up (*a*). One of the twenty changes must now be made, therefore 2 being the hunt in it, must begin its course through the extream bells (*b*). The treble hunts down (*c*); The half-hunt proceeds forward (*d*); the treble hunts up (*e*); the half-hunt proceeds forward in its course (*f*); the treble hunts down (*g*); the 2 proceeds forward (*h*); the treble hunts up (*i*); the half-hunt should now proceed forward, but its course through the extream bells being finished, therefore an extream change must be made betwixt 3.4, which are the two farthest extream bells from it, (*k*). The treble must hunt down (*l*); the half-hunt must now go its course again through the extream bells, and first it moves down under the 6th, (*m*) &c. which method must be continued to the end. Any note may be made a whole hunt at pleasure, or a half-hunt also. And the extream changes may be made betwixt the two nearest extream notes to the half-hunt; but withall observing to make all the extreams in one peal alike. There are four extream changes in each peal, and thirty changes distance from one to another.

	&c.

The method of the Seven hundred and twenty, hath an absolute dependency upon the method of the Sixscore changes on five bells; for five of the notes are to make the sixscore changes, and the sixth note hunts continually through them, and every time it leads or lies behind them, one of the Sixscore changes must then be made. The method of the Seven hundred and Twenty is in effect the same with that of the Sixscore: for as the Sixscore comprehended the Twenty four changes on four, and the Six on three; so likewise the Seven hundred and twenty comprehend the Sixscore changes on five, the Twenty four changes on four, and the Six changes on three. Therefore here must be three Hunts, and three Extream bells: the three Hunts are thus distinguished; one of them is call'd the *whole-hunt*, another the *half-hunt*, and the other the *quarter-hunt*. The Half-hunt, Quarter-hunt, and three Extream bells, are to make the Sixscore changes; the Quarter-hunt and three Extream bells are to make the Twenty four changes, and the three Extream bells are to make the *six* changes, which are here also called *extream* changes, and made in the same manner as before I have shewed upon four bells. In this example here prickt, *treble* is the *whole-hunt*, *2d* the *half-hunt*, *3d* the *quarter-hunt*, and *4 5 6* *extream* bells. Now 'tis observable, that *4 5 6* are to make the six *extream* changes, which will divide the *seven hundred and twenty* into six equal parts; the *3 4 5 6* are to make the *twenty four* changes, wherein the *3d* is the *hunt*, (but in the *seven hundred and twenty* 'tis call'd the *quarter-hunt*;) and *2 3 4 5 6* are to make the *sixscore* changes, wherein the *2d* is the *whole-hunt* (though in the *720* 'tis call'd the *half-hunt*;) by which 'tis evident, that the *treble* continually hunts through these five *2 3 4 5 6*, the *2d* through the four *3 4 5 6*, and the *3d* through these three *4 5 6*; which are assigned for the respective *hunts* to hunt through, from the beginning to the end of the peal. First the *treble* hunts up (*a*). Now one of the *sixscore* changes must be made, therefore the *2d* being the *hunt* in the *sixscore*, must begin its course through the other four notes (*b*). The *treble* hunts down (*c*); the *2d* proceeds in its course (*d*); the *treble* hunts up (*e*). The *2d* proceedeth forward in its course (*f*); the *treble* hunts down (*g*); the *2d* proceeds forward (*h*); the *treble* hunts up (*i*); the *2d*, which is the *half-hunt*, should now proceed forward,

but having finished its course through the four bells, therefore the *3d*, which is the *quarter-hunt*, must begin its motion through the *extream* bells (*k*). The *treble* hunts down (*l*). The *half-hunt* must now begin its course again through the four bells, and first therefore it moves down under the 6 (*m*). The *treble* must hunt up again, and then the *2d* must move down under another bell, which method must be observed untill the *2d* has moved quite down through the four bells again, and then the *3d* must proceed forward by moving over another of the *extream* bells; which method must be observed in the motion of the three *hunts*, until the *quarter-hunt* hath moved up behind the *extream* bells, and then the *whole* and *half-hunts*, having gone their course again through the bells, an *extream* change must be made: after which the *whole*, *half*, and *quarter-hunts* proceed again in their course as before.

<i>m</i>	143526

The letter *h* standing by the figures signifies *half-hunt*, that is, the motion of the *half-hunt* in that change; and likewise *q* the *quarter-hunt*. Here are the first *sixscore* changes of a *seven hundred and twenty*; wherein 'tis observable, that all the changes at *h* and *q* being set down by themselves in the same successive order as they were made, that is, the 1 to be excluded, and the changes on the other five figures to be set down directly under one another, and the *extream* change at last, it will thereby appear, that the five figures have made twenty changes of a *sixscore*, according to the method of the example on five bells, [page 63](#). with this only difference, these are made on 23456, and those were made on 12345; but the five figures of each have both alike course, the *2d* and *3d* going the same course in this, as the *treble* and *2d* did in that. Now whereas the *sixscore* changes here prickt down are a sixth part of the *seven hundred and twenty*, so likewise are the *twenty changes*, here made by 23456, a sixth part of the *sixscore*: and then consequently, the *seven hundred and twenty* changes being all prickt, the *sixscore* changes on 23456 would plainly appear therein, in the same manner as twenty of them appear in this *sixscore*. Therefore more need not be said of the method of the 720, since the method of the *sixscore* changes on five bells being well understood, will be a sure and certain guide to the Learner: only this one thing farther; in ringing of this peal with any *hunts*, the second *extream* change being made between the two bells which made the first *extream*, will always bring the bells round at the end of the *twelvescore*. But after *twelvescore* are made, they cannot in course be brought round until the end of the 720.

<i>q</i>	435621	<i>q</i>	124536	<i>q</i>	456321	Extre. 125463

The 720 changes may be rung one thousand nine hundred and twenty several ways, which is thus demonstrable. There are six times five figures

to be produced out of six, and not twice five the same: as 12345. 12346. 12356. 12456. 13456. 23456. and with each five the *sixscore* changes may be prickt one hundred and sixty ways, as before I have shewed on five bells. Now to each five add the sixth figure which is wanting, as to 12345 add 6, to 12346 add 5, to 12456 add 3, to 13456 add 2, and to 23456 add 1. And the sixth figure which is added, being hunted through all the several *sixscores* which the other five figures make; for instance, the 6 through the 160 several *sixscores* which 12345 make, and the 5 also through the 160 several *sixscores*, which 12346 make, and the like of the rest; will produce as many *seven hundred and twenties* as there are *sixscores*, that is, six times one hundred and sixty, which amounts to nine hundred and sixty. Then the note that hunts through the other five, may hunt two ways through each *sixscore*, that is, up and down, which will double the former number, and make nineteen hundred and twenty in the whole.

AN INTRODUCTION to the Knowledge of *CROSSE PEALS.*

These Peals are term'd *cross* in respect of their intricate methods; wherein several notes moving at one and the same time, do thwart or *cross* each other in their course and motion, some moving up, others at the same time down, gives this Denomination to the Peals. The end of pricking them is to make the compleat number of changes by a method differing from that of other Peals. For although five can be varied but 120 ways, and six but 720 &c. yet the methods by which they are varied, are differing, according to the several fancies of the Artist. And as order and method are the only *basis* on which this Art is founded; so the skilful Artists, the better to effect the aforesaid end, have thought fit in most peals to appoint one note to be as it were a Helm or Rudder, by which the course of the peal is steered; which note is term'd a *Hunt*, and hath one constant uniform motion throughout the peal, differing from that of the other notes. The manner of its motion is continually through the other notes, that is, from leading to strike behind, and from thence again to lead, which motion, first up and then down, is term'd one compleat Course. Some peals upon five bells, as *old Doubles*, &c. consist of single Courses; there being ten changes in every single Course, and twelve of those Courses in the peal. Other peals upon five bells, as *London Paradox*, &c. consist of double Courses; there being twenty changes in every double Course, and six of those Courses in the peal. Upon six bells there are also single and double Courses, viz. twelve changes in every single Course, as in *Grandsire Bob* &c. and twenty four changes in every double Course, as in *Colledg Bob*, &c. the change wherein the *Hunt* leaves leading being the first change of every Course. Now the methods of these peals being well considered, they will be found more easie

than at the first view they may seem to be; for the first Course of any Cross Peal being judiciously viewed, the general method of the whole peal will thereby appear: for all the Courses in a Cross peal do agree in these three respects. First, in the motion of the *Hunt*; secondly, in the motion of the rest of the notes; thirdly, in the making of the changes, which will plainly appear in the following peals, (some few changes in each peal only excepted, as hereafter I shall shew in my Directions to the several peals:) for proof of which I will give an instance in the peal of new Doubles upon five bells, these being the three first Courses of the peal. Wherein 'tis observable, that the last change of the first Course which is 13524, I have set down again at the top of the second Course; and likewise the last change of the second Course which is 15432, I have also put at the top of the third course; which I have done for the plainer Demonstration of what I here intend. So that the ten lowermost changes are the ten changes of each Course.

First Course	2d Course	3d Course
12345	13524	15432
21354	31542	51423
23145	35124	54132
32415	53214	45312
23451	35241	54321
32541	53421	45231
23514	35412	54213
32154	53142	45123
31245	51324	41532
13254	15342	14523
13524	15432	14253

First therefore, as to the motion of the *hunt*, the 1 which is the *hunt* moves directly up behind, where it lieth twice, and then down again to lead, where it lieth also twice; as appears in each of these three Courses, and the like also throughout the peal.

Secondly, as the *2d*, *3d*, *4th*, and *5th* bells move through the first Course, so the bells that lie in the *2d*, *3d*, *4th*, and *5th* places in the last change of every course, moves in the same manner also through the next following course. For instance; first, for the bell in the *2d* place: in the first

course the *2d* bell moves down to lead, where it lieth twice, and then dodges untill the *treble* comes down to it. So likewise in the second course, the *3d* bell lying in the *2d* place moves down to lead, where it lies twice, and then dodges until *treble* comes down to it; and also in the third course, the *5th* bell lying in the *2d* place, moves down to lead where it lieth twice, and dodgeth until the *treble* moves down to it. Secondly, for the bell in the *3d* place. In the first course the *3d* bell moves down to lead, and there dodgeth untill the *treble* comes down to it: so likewise in the second course the *5th* bell lying in the *3d* place moves down to lead, and there dodgeth untill the *treble* comes down to it: and also in the *3d* course the *4th* bell lying in the *3d* place moves down to lead, and there dodgeth until the *treble* comes down to it. Thirdly, for the bell in the fourth place: In the first course, the fourth bell moves up behind, then down into the *3d* place where it lieth twice, then up again behind; so likewise in the second course, the *2d* bell lying in the *4th* place moves up behind, then down into the *3d* place where it lieth twice, then up again behind; and also in the third course the *3d* bell lying in the *4th* place, moves therefore up behind, then down into the *3d* place where it lieth twice, then up again behind. And such uniform motion also hath the bell in the *5th* place through every course.

Thirdly, that the changes in all the courses of the peal are made alike, will here also plainly appear in the three courses. For the first change of every course is made on the two first and two last bells; the second change of every course is made on the four last; the third is made on the four first; the fourth on the two first and two last; the fifth on the four first; the sixth on the two first and two last; the seventh on the four first; the eighth on the four last; the ninth on the two first and two last; and the tenth single.

And thus in every Cross-peal the Courses do all agree, first in the motion of the Hunt, secondly in the motion of the rest of the notes, and thirdly in the making of the changes, as before I have showed. So that these three things being well observed, will be very helpful both in pricking and ringing them; the first and third being most proper to direct the pricking of them, and the first and second the ringing of them. Therefore if the Practitioner do but observe how the changes are made in the first course of a peal, wherein he must have particular regard to the motion of the Hunt, (with a little further help from the following directions to each peal, as to the making of *Extreams* and Bob-changes) he may easily prick down all the following Courses of the same peals and therefore in the following peals I

have onely prickt down two or three of the first courses for an example, and then have abridged the rest of the peal by setting down only the changes that are made at the leadings of the Hunt. But note, there are some few *Cambridg*-peals upon five bells, wherein all the courses of each peal do not agree in the aforesaid three respects: For although as to the motion of the *whole-hunt* they do, yet in the motion of the rest of the notes, and consequently in the making of the changes they do not.

It being very difficult to begin the following peals with cross *hunts*, that is, to make the *2d, 3d, 4th &c.* whole-hunts, I will therefore set down a general rule for making the first changes at the beginning of each Peal, wherein consists the great difficulty. In any Cross-peal the *whole-hunt* may move either up or down at the beginning; and the motion of the *whole-hunt* in the first course of each of the following peals will direct the first motion of any cross *hunt*, and consequently of making the first changes in that peal. For Example, admit the *4th* were made the *whole-hunt* in the peal called *Old doubles and singles* upon five bells, and to *hunt* up at first: now to know how to make the first changes, observe how the change is made wherein the treble (which is there the *whole-hunt*) moves up out of the *4th* place, and in the same manner must the change be made wherein the *4th* bell also moves up out of that place: therefore as the change wherein the treble moves up out of the *4th* place is a *single* behind; so likewise must the change wherein the *4th* bell moves up out of that place, be also a *single* behind thus, 12354: and then as the next change wherein the treble lieth still behind is double of the four first bells; so likewise the next change wherein the *4th* bell lieth still behind, must also be made on the four first, thus, 21534, &c. Or admit the *4th* were to hunt down at the beginning, then observe how the change is made wherein the treble hunts down out of the *4th* place, and so in like manner must the change be made wherein the *4th* hunts also down out of that place: therefore as the change wherein the treble hunts down out of the *4th* place, is double of the four first bells; so likewise must the change wherein the *4th* bell hunts down out of that place, be also double of the four first thus, 21435; then as the *treble* makes a *single* when it moves down out of the *3d* place, so likewise must the *4th* next make a single change in moving down out of the *3d* place thus 24135, &c. which observations will guide the making of the first changes in any cross peal with any Hunts; but observe whensoever the first change of any peal happens to be single, it must be made at the back-stroke to prevent cutting

compass; and the like when a double change happens first in a peal of Triples and Doubles. And moreover by the way observe, that all the following peals are so prickt, that in ringing them at half-pulls, if the first change of each peal is made at the fore-stroke, the single changes in each peal will always be made at the back-stroke; and also the double changes in Triples and Doubles, excepting some few Single in two or three peals. But when it happens that the first change of a peal is made at the back-stroke, then consequently the bells at the end of the peal will come round at a fore-stroke change.

In such peals on five bells where *singles* are made in the *3d* and *4th* places at the leadings of the *whole-hunt*, the *extreams* may there be made three ways in each peal; viz. every time the *half-hunt* lieth next to the *whole-hunt*; secondly, every time it lieth behind; thirdly, every time the *half-hunt* lieth next the *whole-hunt*, and also behind: in this last way there are six *extreams* in each peal, but in other ways only three in each; the *extreams* being always made when the *whole-hunt* leads, and betwixt the two farthest *extream* bells from the *half-hunt*.

In such peals upon five bells wherein there are three *extreams*, and made in the *3d* and *4th* places at the leadings of the *whole-hunt*; the rest of the *singles* at the leadings of the *whole-hunt* may be made two ways in each peal, viz. either in the *2d* and *3d*, or the *4th* and *5th* places; if they are made in the *2d* and *3d*, then the *extreams* must be made when the *half-hunt* lyeth behind; but if the *singles* are made behind, then the *extreams* must be made when the *half-hunt* lieth next the *whole-hunt*, the *extreams* being always made between the two next *extream* bells to the *half-hunt*.

In all the following peals the figures standing by themselves at the title of the peal, are the *hunts* in the peal there prickt: for instance, in the first *cross-peal* upon five bells call'd *Old doubles and singles*, the two figures standing thus *1 and 2*, are the *hunts* in that peal; *1* is the *whole-hunt*, *2* the *half-hunt*, and the like of the rest.

All peals of *doubles* upon five bells, which go sixty changes compleat without any *single*, by making of two *extreams* they will go 120. And also all peals of *doubles* upon six bells, and *triples* and *doubles* upon six, which go 360 changes without any *single* or *extreme*, by making of two *extreams* they will go 720. The *extreams* in all these compleat peals proceeding from one and the same cause, are therefore to be made after one manner,

according to this general and infallible rule: Wheresoever any two of the *extream* bells are in course to make a change, those two bells by lying still will effectually make the *extream*. So that the making of the *extream* in *doubles* upon five bells, necessitates the making of a *single change* at the same time, by reason that the two *extream* bells which should contribute to the making of the *double* change, do lie still; so that the *single* change is accidental, and very improperly called the *extream*. When the *extreams* in *triples* and *doubles* upon six bells are made at *double* changes, then there happens two *singles* in the peal; but when they are made at *triple* changes, then those two changes will become *double*, and consequently the 720 will then go compleat without any *single*. Upon five bells the first *extream* must be made within sixty changes from the beginning, and the second *extream* just sixty changes from the first. Upon six bells the first *extream* must be made within 360 changes from the beginning, and the second *extream* just 360 changes from the first. The easiest way in practice, is to make the *extremes* at the leadings of the *whole-hunt*; wherein it may be observed as a general rule, That in all peals upon six bells, where the *half-hunt* dodgeth behind at the *bobs*, there the first *extream* may be made either the first, second, or third time: the *half* and *quarter-hunts* dodg together behind, and then the second *extream* must be made the third time those two bells dodg again together behind, after the first *extream* is made. And also in all such peals upon six bells, where the *doubles* at the leadings of the *whole-hunt* are made on the four middle bells, there the first *extream* may be made either the first, second, or third time the *half* and *quarter-hunts* do make a change in the 2d and 3d places, and then the 2d *extream* must be made the third time those two bells come there again to make a change after the first *extream* is made. The *singles* at all these *extreams* must be made by the *half* and *quarter-hunt*. The first *extream* in any peal may also be made at any place, where two of the *extream* bells are in course to made a change according to the preceding general rule; and then the making of the second *extream* may be guided by observations taken from the changes at the leadings of the *whole-hunt*: for at the leadings of the *whole-hunt* the *half* and *quarter-hunts* always come together to make a change in one place, just at 120 changes distance from one another throughout each peal. Now as the second *extream* must be made just 360 changes from the first, so the making of it may thus be guided: Look how many changes, or else how many leadings of the *whole-hunt* the first *extream* is made after the *half* and

quarter-hunts have made a change together, so many changes or leadings of the *whole-hunt* must the second *extream* be made, after the third following time that those two bells do made a change in the same place again. And likewise in all peals, where there are single and double *bobs*, the same observations will also hold good, in making the *extreams* either after the single or double *bobs* as before; there being likewise 120 changes distance between the single *bobs* and also between the double *bobs*: so that if the first *extream* is made at a single *bob*, the second must then be made at the third following single *bob*, and the like also at double *bobs*. And such kind of observations, according to the nature of the peal, will guide the making of the second *extream* in any peal, either upon five or six bells. Wherein 'tis observable, that the second *extream* must always be made by the same two bells, and in the same place where the first was made, which two bells will in course lie apt for that purpose; and the rest of the bells will also in course lie in the same places at the second *extream* where they lay at the first. After the making of the first *extream*, the method of the peal goeth on as if no *extream* had been made; and also after the making of the second *extream* if any remaineth, it also goes on, until in course the bells come round.

In all compleat peals of *doubles* upon six bells there may also moveable *extreams* be made, which are made according to this rule; wheresoever any two of the *extream* bells are together, and in course to lie still, those two bells by making a change will thereby make the *extream*, which is as effectual as the fixed *extream*, the reason and ground of both being one and the same. There are also two of these *extreams* in the peal, and the second always made 360 changes from the first, and the making of it guided by such kind of observations as before. When moveable *extreams* are made, then there will be two triple changes in the 720; but when fixed *extreams* are made, then two *singles*.

The art of *cross-pricking* may receive a being from this consideration. As every compleat peal of plain changes upon one number comprehends the compleat peals on all lesser numbers; so likewise every compleat *cross-peal* must of necessity do the like, although their cross course permits it not to be done so regularly and demonstrably as the former. From whence may be inferr'd, that every note in a *cross-peal* must of necessity lie as many times in one place, as the rest of the notes are capable of making changes; and also that two or more of the notes must jointly lie in the same places as many times, as the remaining number are also capable of making changes:

this being a certain touchstone to prove all *cross-peals* after they are prick't, and must be held as a principle on which to ground such methods of pricking, that the course of all the notes may demonstrably tend to produce those effects. And from hence it is, that the whole *hunt* immediately derives the manner of its uniform motion through the courses of each peal. And the changes in every course are as so many guides to conduct the rest of the notes in such sort, that they may be prepared to lie at the last change of the course in apt places for each succeeding course to receive them, and to perform the like. Now as the changes in all the courses of a peal are made alike, except as before; so in the composing of *cross-peals*, by pricking of one course may soon be discovered, whether or no a compleat Peal will from thence arise.

Cross Peals.

The Twenty four, Doubles and Singles on four Bells.

This peal consists equally of *double* and *single* changes; one change is *double*, the next *single*, and so throughout. 1 is here the *hunt*, and 2.3.4 *extream* bells. Every *double* change is made on the two first and two last bells, and every *single* on the two middle bells, except when the 1 leads, and then behind which is call'd *extream*. All the bells have a direct Hunting course up and down until 1 leads, and then the bell in the second place lyeth still, whilst the two hind-bells make a dodg; which being made, all the bells proceed again in their Hunting course. The three changes of (a.b.c) are the three *extream* changes.

There are three ways to make the *extream* changes. First, every time the *hunt* leads, as in the peal here prickt; secondly, every time it lies behind; thirdly, every time it leads and lies behind: in this last way there are six *extream* changes in the peal, but in the other two ways, only three *extreams*; the *extream* changes must always be made betwixt the two farthest bells

from the *hunt*. Any bell may *hunt* at pleasure, and it may move either up or down at the beginning of the peal. If the *1st* or *3d* do *hunt* down, or the *2d* or *4th* up at the beginning, the first change must be *single*, and made of the back-stroke (if 'tis rung at half-pulls) to prevent cutting compass; but if either of those bells do *hunt* the contrary way, then the first change must be double.

Old Doubles and Singles. 1 and 2.

One change is *double*, the next *single*, and so by turns. The treble hath a direct hunting course, as in plain changes. Every *double* change is on the four first bells, and the treble is one of the two bells that makes every *single* change, except when it leads, and then the *single* is in the *3d* and *4th* places; but when 2 lies next the treble, then the *single* is behind, which is call'd *extream*. Every time the treble leaves leading, the two first bells continue slow dodging, until the treble comes down and displaceth them. And when the treble moves down out of the *5th* place, the bell that comes into it lies still there, untill the treble comes thither again, except when the *extream* change is made behind. Every bell lies twice together in the *3d* and *4th* places, except when the treble leads, and also when it hinders them in hunting.

<u>12345</u>	51432	————

54132	14325	

This old peal may be rung by a new course, which differs from the former only in the *single* changes that are made every time the *whole-hunt* leads, viz. every *single* may be made either in the *2d* and *3d*, or *4th* and *5th* places. If they are made in the *2d* and *3d*, then the *extreams* must be made when the *half-hunt* lies behind; but if they are made in the *4th* and *5th* places, then the *extreams* must be made when the *half-hunt* lies next the *whole-hunt*, the *extreams* being always made in the *3d* and *4th* places.

London Paradox. 1 and 2.

One change is *double*, the next *single*, and so by turns. The motion of the treble is after this manner; in hunting up, first, it makes a dodg in the *2d* and *3d* places, then it lies twice in the *4th* place, and four times behind; in which manner also it hunts down again, and then leads four times. The rest of the bells have a like course and motion with that of the treble, untill the treble leads. Now 'tis observable, that every *single* change is made in the *2d*

and 3d places until the treble leads, and then in the 3d and 4th places; but when 2 lies next the treble, then an *extream* behind. The changes at the leadings of the *whole-hunt* have an absolute dependency upon the course of the *twenty four* changes, *doubles* and *singles* upon four bells; and the *extreams* to be made as many ways as in that peal, which are here guided by the motion of the *half-hunt*.

Mr. Tendring's Peal, call'd Grand Paradox. 1 and 5.

One change is *double*, the next *single*, and so by turns. The motion of the *whole-hunt* is after this manner: first, it moves up into the *2d* and *3d* places, lying twice in each; then it moves up and makes a *dodg* behind, and then lieth still one change in the *5th* place; then it makes another *dodg* behind, and so moves down into the *3d* and *2d* places lying twice in each as before, and then leads four times. Every other bell hath a like course and motion with that of the treble until the leadings of the treble, and then observe, that every time the treble goeth to lead and leaves leading, the *double* change is made on the two first and two last bells, except when it goeth to lead if the *half-hunt* lies next it, and then not. Every bell leads four times, and every *single* is made behind. The change wherein each bell leaves leading, is always made on the four first bells, except as before.

New Doubles.

1 and 2.

The changes are all *double*, except one *single* at every leading of the treble. The treble hath a perfect hunting course as in plain changes; and when it moves up from leading, the two first bells dodg untill it comes down again and displaceth them. Every bell that comes into the 3d place lies there twice, and then moves up behind; but the bell which lies there when the treble leaves leading, moves down. Every bell lies twice behind, except at the changes wherein the treble goeth to lead and leaves leading. Every time the treble leads, a *single* change is then made in the 3d and 4th places; but when the 2 lies next the treble, an *extream* behind.

Reding Doubles. 1 and 2.

The treble hath a direct hunting course as in plain changes, and when it moves up from leading the two first bells dodg until it comes down again and displaceth them; and whilst they dodg before, every bell that comes down into the *3d* place lies there twice, and then moves up again behind. But after the dodging all the bells go a direct hunting course up and down, until the dodging again hindreth them as before. Every bell lies twice behind, except when the treble leaves leading if the *2d* lies next it, and then the *double* is made on the two first and two last bells; by which means the two hind-bells then make a dodg, which happens in course once in twenty changes, that is, every second time the treble leaves leading. By this method it will go sixty changes, and then an *extream* must be made. The *extreams* in this peal may be made according to the preceding general rule set down in the *Introduction*. Here the first *extream* is made at the end of sixty changes, the bells lying 1 3 2; and when they come to lie so again, the second *extream* must be made; the *extream* is made behind, two of the *extream* bells lying there, and the *single* is made in the *2d* and *3d* place at both the *extreams*.

Grandsire. 1 and 5.

The treble hath a direct hunting course as in plain changes, and every other bell hath also a like hunting course with that of the treble except when the *bobs* hinder. The *bobs* are double changes, and made on the two first and two last bells according to this rule, *viz.* every time the *treble* goes to lead and leaves leading, a *bob*-change is then made, except the *5th* lying next it makes a change there with it, and then not. Now 'tis observable, that once in twenty changes, that is, at every second leading of the treble, the *5th* lies next it, and consequently there is but one *bob*-change then to be made, but at other times two; so that at one leading of the treble there is but one *bob*-change made, at the next leading there are two, and so successively by turns, which for distinction may be call'd *single* and *double bobs*, The two

bells that dodg behind at a *bob* continue there dodging until the treble comes up and displaceth them, and at every *bob-change* the bell in the *3d* place lieth still, and then moves down to lead. By this method it will go sixty changes; and to carry on the course *extreams* must be made, there being two in the peal. The manner of making an *extream* I have at large shewed in the *Introduction*, and the *extreams* may here be made in any place according to the general rule there set down. The easiest way in practice is to make them at the leadings of the treble; at any single *bob* it maybe made behind, two of the *extream* bells lying there, and to lie still whilst the bells in the *2d* and *3d* places do make the *single* change: at any double *bob* it may be made in the *2d* and *3d* places, so that the *single* must there be made behind. If the first *extream* is made at the single *bob*, the second must be made at the third following single *bob*; or if the first is made at a double *bob*, the second must be made at the third double *bob* following, as in this peal here prickt, where the first *extream* is made at a double *bob*, and the second also made at the third following double *bob*.

This peal will go with any *hunts*, and to begin it on the four hind bells; but then in ringing it at half-pulls, the first change being made at back-stroke to prevent cutting compass, the bells at the end of the peal will come round at a fore-stroke change. Therefore the better way is to begin it on the four first bells, which may also be done with any *hunts*, excepting 1.3, 1.5. and 2.3, 2.4, 2.5, wherein the first change of each may be a *bob*. And observe, that in any way of beginning it, the bells must all proceed in such a

perfect hunting course as the first change directs them, until the first *bob* comes to be made.

Old Triples and Doubles.

One change is *triple*, the next *double*, and so by turns, except one *single* at the end of every sixty changes. Every *triple* change is made on the two first, the two middle, and two last bells; and every *double* is made on the four middle bells, except when the *hunt* leads and then on the four hind bells. Treble is here the *hunt*, and hath a direct hunting course up and down as in plain changes: the rest of the bells have also a direct hunting course up and down except when the treble leads, and then each bell that was hunting up (except that in the *2d* place) makes a dodge with the next bell below it, and then proceeds forward again in its course up; and each bell which at the same time was hunting down, makes a dodg with the next bell above it, and so proceedeth forward in its course down; which method will carry on the peal five *courses* of the *hunt*, that is sixty changes as they are here prickt.

In the 120 there is also a *half-hunt*; and when the *whole-hunt* leads and the *half-hunt* lies next it, a single change must then be made, either in the *3d* and *4th*, or *5th* and *6th* places; but observing when the *half-hunt* comes again to lie next the *whole-hunt*, another single change must be made in the same place where the first was made. These single changes are called *extreams*, there being two in every *sixscore*, and the last of them always falls out in course to be made just 60 changes from the first, that is, at the fifth leading of the whole *hunt* after the first *extream*.

<u>123456</u>	135264	156342	164523	142635

536142	654123	462135	243156	325164
351624	561432	641253	421365	231546
315264	516342	614523	412635	213456
132546	153624	165432	146253	124365

In the 240 there is also a *half-hunt*; and when the *whole-hunt* leads, and the *half-hunt* lies next it, a single change being then made in the 4th and 5th places, will bring the bells round at *twelvescore*, there being four *singles* in the peal, one of which falls in the course at the end of every sixty changes.

In the 720 there is a whole, half, and quarter *hunt*, and every time the *whole-hunt* leads and the *half-hunt* lies next it, a single change must then be made in the 4th and 5th places as in the *twelvescore*; but when the *quarter-hunt* lies next the *half-hunt*, that is, when the three *hunts* come together before, (which always happen at the end of every *twelvescore*) then the *single* must be made behind, which is call'd *extream*, there being three of them in the peal.

The *sevenscore* and *four* triples and doubles are the same with the former except at the leadings of the treble, and then a *single* is always made in the 3d and 4th places; but when the 2 lies next the treble, an *extream* is made in the 4th and 5th places. This peal is grounded on the *twenty four* doubles and singles, the four middle bells making them at the leadings of the treble.

Grandsire Bob. 1, 2 and 4.

The general method of this peal is the same with that next before, but with this difference; whereas in that peal *singles* were made at the end of every sixty changes to carry on the course, in this there are *double* changes made in their stead, which are called *Bob*-changes, and made when the treble leads in the *2d* and *3d* and the *5th* and *6th* places, whereas at other times the *double* is there made on the four hind bells.

The Practitioner may observe these rules in the ringing of it, viz. whatsoever bells he followeth when he hunteth up, he must follow the same bells again, and in the same order, the next time he hunts down, as in these changes here prick't; where the treble in hunting up first follows 2, then 4, and then 6; and when it comes behind, first it follows 2 again, then in its hunting down it follows 4 and 6 in the same order as when it hunted up; which is also observed in the ringing of any other bell, but with this difference betwixt the *whole-hunt* and the rest of the bells, viz. Every time the *whole-hunt* leaves the *treble's* place and hunts up, it followeth different bells from what it did in its former hunting up, as may be seen in this example: where in its first hunting up it first follows 2, then 4, then 6; whereas in the next hunting up it first follows 3, then 2, then 4. But the first time any other bell leads after a *bob*, whatsoever bells it then follows in its hunting up, it follows the same bells likewise and in the same order every time it hunts up, and consequently every time it hunts down unto the next *bob*; as in this example, where 2 in its first hunting up, first follows 4, then 6, then 5, and likewise when it next hunts up it follows 465 as before, &c. But when the *whole-hunt* is the second bell which he follows in hunting up, he must follow it again when he next lies behind.

'Tis observable, that at every leading of the treble the two hind bells dodg; and whensoever the *half-hunt* dodgeth there, a *bob* must then be made, except the *quarter-hunt* dodgeth there with it, and then not; which is an infallible rule, by which he that rings the *half-hunt* may always give notice of the *bobs* as well when the peal is inverted, as in the ordinary way of ringing it. The *bobs* fall out in course single and double, the one single, the next double; and so by turns; there being three single *bobs* and three double *bobs* in the *eighteenscore*, and consequently six of each in the 720.

The aforesaid method being observed, will carry on the course of the peal to the end of *eighteenscore*, which is just half the 720, and then it terminates, as appears in the *eighteenscore* here prickt: but by making an *extream* that number may be doubled; for then *eighteenscore* changes more will go in course according to the former method; and another *extream* being likewise made at the end of the last *eighteenscore* will compleat the 720. The manner of making an *extream* I have shewed at large in the *Introduction*, page [90](#). where I have also set down a general rule for making them, to which I refer.

The first *extream* may be made either the first, second, or third time that the half and quarter *hunts* dodg behind; or else at the first, second, or third single *bob*; at either of which places the *single* must be made behind.

614523	314256	245163	145236	124365

Here are *eighteenscore* changes wanting one, which one if it were made double as the former, would bring the bells round, therefore an *extream* must be made as in this change 123465, the two hind bells making the *extream*, and the bells in the 3^d and 4th places making the *single*. Now in regard that this *extream* is made the second time the *whole-hunt* leads after a double *bob*, therefore the second *extream* must be made the second time the *whole-hunt* leads after the third double *bob* following.

This peal may be rung with any *hunts*, and to begin the changes *triple* and *double* as in this here prickt.

***Fifty three LONDON-Peals
upon Five, Six, Seven, and Eight
Bells, composed by F.S.***

Crambo.

The changes are all *single*; it hath a perfect course, and may be prickt many ways.

The Primrose. 1 and 2.

The treble hath a perfect course as in plain changes. And when it hunts up out of the *2d* place it makes two *singles* together, and the like when it hunteth down. When it leads, the *single* is in the *3d* and *4th* places, except when 2 lies next it, and then an *extream* behind. Every bell (except the treble) leads four times, and lies still behind untill the treble displaceth it, except at the *extream*.

One change is *double*, the next *single*, and so by turns.

New Doubles and Singles. 1 and 2.

One change is *double*, the next *single*, and so by turns. The treble hath a direct hunting course up and down as in plain changes, and every time it goeth to lead and leaves leading, the change is *double* on the two first and two last bells, the rest of the *double* changes are on the four first. The treble is one of the two bells that makes every *single* change except when it leads, and then the *single* is made in the 3^d and 4th places; but when the 2 lies next the 1, then an *extream* is made behind. When the treble leaves the two first bells, they continue slow dogging until treble comes down and displaceth them. Every bell (except the treble) lieth twice in the 3^d place.

The Morning Star. 1 and 2.

The treble hath a direct hunting course as in plain changes; and every time it hunts up, it makes two *singles* together, and the like when it hunts down: when it leads the *single* is behind, but when 2 lies next it an *extream* is made in the 3^d and 4th places. Every time the treble goeth to lead and leaves leading, the double is on the two first and two last bells, and every bell except the treble leads four times together.

When the treble leaves the two hind bells, they continue dodging untill it comes up again and displaceth them, and then they hunt directly down; the first to lead, and the other into the *2d* place: that which moves to lead, having lead four times, gives place to the treble; but when the Treble hath done leading it takes the treble's place again, and leads four times more and

then hunts directly up; the other bell which moved down into the 2^d place lies there twice, and then the Treble in hunting down moves it into the 3^d place where it lies still, untill the Treble in hunting up moves it back into the 2^d place, where having lain twice it hunteth up. This Peal is as musical, easie, and practical as any of this kind that ever was prickt.

The Faulcon. 1 and 2.

This Peal consists most of *double* changes. The treble hath a direct hunting course as in plain changes, and every time it hunts up and down it makes a *single* in the 3^d and 4th places, and when it leads a *single* is also made there, but when 2 lies next it the *extream* is made behind. When the treble leaves the two first bells they continue there until it comes down again and displaceth them, but observe, when the treble moves into the 5th place, and again from thence, the *double* is on the two first and two last bells, by means of which the two first bells then dodg, but before and after they lie still. Every bell lies twice in the 3^d place and then hunts up, except that which lies there when the treble leaves leading.

Merry Andrew.
1 and 2.

One change is *double*, the next *single*, and so by turns. The treble leads four times, lies behind four times, and twice in every other place. Every other bell leads four times. When the treble leaves the two hind-bells, they continue dodging untill it comes up again and displaceth them. Every *single* is made behind until the treble hinders, and then in the *2d* and *3d* places. When the treble leads and the *2d* lies next it, then an *extream* is made in the *3d* and *4th* places.

When the treble goes to lead and leaves leading, the *double* is on the two first and two last bells, and when every other bell goes to lead and leaves leading, the *double* in on the four first.

May-day. 1 and 5.

One change is *double*, the next *single*, and so by turns. When the treble goes to lead and leaves leading, the *double* is on the two first and two last bells; and when every other bell goes to lead and leaves leading, the *double* is on the four first.

The treble hath a constant dodging course, for in its hunting up it first makes a dodg in the second and third places, and then another behind, and then it lies still one change in the *5th* place; then in its hunting down it makes another dodg behind, and also another in the *2d* and *3d* places, and then leads four times. So that the treble in one of the two bells that makes every *single* until it leads, and then 'tis made in the *2d* and *3d* places, except when the *5th* lies behind, and then an *extream* is made in the *3d* and *4th* places. When the treble leaves the two hind-bells they continue slow dodging, until it comes up again and displaceth them. Every bell leads four times.

St. Dunstan's Doubles. 1 and 2.

The changes are all *double* except one *single* every *2d* time the treble leads, there being six in the peal. The treble is a perfect *hunt*; and every time it goeth to lead and leaves leading, the *double* is made on the two first and two last bells, at which changes the bells in the *3d* place lie still and then move down, and the two hind-bells at the same time *dodg*; but at other times all the bells have a direct hunting course. When the treble leads, and the *2d* lieth either in the *2d* or *3d* places, then a *single* must always be made betwixt the two next *extream* bells to the *2d*.

Church Doubles. 1 and 2.

The changes are all *double* except six *singles* as the former. The treble is a perfect *hunt*; and every time it moves up into the *5th* place, and also out of it, the *double* is then made on the two first and two last bells, at which time the bells in the *3d* place do lie still and then move up; and the two first bells at the same time *dodg*. When the treble leads, and the *2d* lieth either in the *2d* or *3d* places, then a *single* must always be made betwixt the two next *extream* bells to the *2d*.

In this and the former peal the *singles* may be made in another manner, viz. when the *whole-hunt* leads, and the *half-hunt* lieth either in the *4th* or *5th* places, a *single* must then be made betwixt the two next bells to the

half-hunt; but at other times a *double* change to be made when the *whole-hunt* leads, as in the former way.

Stedman's Principle.

The changes are all *double*, two *singles* excepted. One *double* is made on the two first and two last bells, the next on the four last, and so by turns successively; excepting every sixth change, which is *double* on the four first bells, and for distinction is called a *Parting* change. All the bells have a like course. The general method is this; the three first bells go the *six* changes, and the two hind-bells in the mean time dodg; then a *Parting* change is made which parts the two hind-bells, moving that in the fourth place down into the *3d*, and that in the *3d* place up into the *4th*, and then the three first bells go the *six* again, the two hind-bells in in the mean time dodging as before; and then another *Parting* change is made, and so successively on. Every bell that comes behind continues there dodging six changes with one bell and six with another, and then in course the *Parting* change brings it down. One *six* cuts compass, the next doth not, and so by turns successively. In the *six* which cut compass the two first bells of the three makes the first change of it, but in the other the two last of the three. By this method the peal will go sixty changes, and to carry it on farther *extreams* must be made. An *extream* is made by the lying still of two bells when in course they should make a change, as before I have shewed more fully in the *Introduction*, page [90](#). but withall observing, that whereas in this peal the bells have all a like course, therefore they may all be termed *extream* bells, and consequently the *extreams* to be made according to this general rule, viz. the first *extream* may be made by any two bells that are in course to make a change within the compass of the first sixty changes of the peal; and the second *extream* must be made according to this rule. Whatsoever two bells are dodging behind at the first *extream*, when the same two bells come to dodg there again, is a certain warning for the second *extream* to be then made. And observe, how many changes the first *extream* is made from a *parting* change; so many likewise must the last *extream* be made after a *Parting* change also. And the *single* and *extream* comes in course each of them to be made in the same place and by the same bells at the last *extream*, as they were at the first. Here the *singles* are made behind, and the *extreams* in the *2d* and *3d* places; and as the *4th* and *5th* bells do dodg behind at the first *extream*, so likewise when they come to dodg there again, the second

extream is then made, the treble leading at both of them, as appeareth in the peal here prickt.

The first *Parting* change is here made the third change at the beginning, and that six cuts compass.

In all the several ways of ringing this peal, if the *Parting* changes are made at the fore-stroke, as in course they are in this here prickt, then cutting compass is always on the same *sixes*, as in this peal: but when the *Parting* changes are made at back-stroke, then the contrary *six* always cuts compass to what doth here.

Peals upon Six Bells.

The single Method.

The changes are all *single*, and treble is the *hunt*. When the treble moves up out of the *2d* place, the two first bells continue slow dodging untill the treble comes there again. And when the treble moves down out of the fourth place, the two hind-bells likewise continue slow dodging until the treble comes there again. When the treble leads, (if 'tis rung at half-pulls) the *fore-stroke change* (that is, at the third stroke of the treble's leading) is made in the *3d* and *4th* places, the rest of the changes there are made behind. By this method it will go *sixscore* changes.

To ring 240. When the *whole-hunt* leads, and the *half-hunt* dodgeth behind; the *fore-stroke change* must then be made in the *2d* and *3d* places, as in this here prickt, where the *2d* is the *half-hunt* and there are little marks set at the *fore-stroke changes*.

To ring 360. When the *whole-hunt* leads, and the *half* and *quarter-hunts* dodg behind, the *fore-stroke change* must then be made in the *2d* and *3d* places as before.

To ring 720. When the *whole-hunt* leads, and the *half-hunt* dodgeth behind, the *fore-stroke* change must then be made in the 2d and 3d places as before, except the *quarter-hunt* dodgeth there with the *half-hunt*, and then in the 3d and 4th places as at other times. The 2d an 4th, or the 2d and 6th may be the *half* and *quarter-hunts*, or others at pleasure.

“*Note*, in all the following peals upon six bells, the *bobs* are double changes, and always made at the leadings of the whole hunt (except *No-such Bob*, for there the Bobs are made at the change wherein the whole-hunt goeth to lead, and not when it doth lead.) And whereas in the following peals the directions for calling *bob* runs thus; viz. *Every time the half-hunt dodgeth behind, a Bob must then be made, &c.* ’tis there implied, That whereas every time the whole-hunt leads, the two hind-bells then dodg; therefore when the half-hunt dodgeth there at the leading of the whole-hunt, a *bob* must then be made. And in like manner also must all the *bobs* in the following peals be made at the leading of the whole-hunt. He that rings the half-hunt may best call *bob* in all peals.”

A Cure for Melancholly.

Doubles and Singles. The Treble is the *whole-hunt* which leads four times, lieth behind as many, and twice in every other place. When it moves up out of the fourth place, the two bells in the third and fourth places continue dodging until it comes down there again, and then the two hind-bells dodg until the Treble displaceth them. The Treble is one of the bells which maketh every *double* change, except when it lieth still behind, and then the *double* is on the four first, and also when it leads the *double* is on the four last. Every *single* is made in the fifth and sixth places, except when the Treble lieth there, and then in the third and fourth places. Every bell except the Treble lieth four times in the second place. By this method it will go *sixscore* changes, but by making of *bobs* it will go 240, 360, or 720. The *bob* is a *double* change at the leading of the Treble, wherein the bell in the fourth place lieth still.

To ring 240. Every time the *half-hunt* dodgeth behind, a *bob* must then be made as in this here prickt, where 2 is the *half-hunt*.

To ring 360. Every time the *half* and *quarter-hunts* dodg together behind, a *bob* must then be made.

To ring 720. Every time the *half-hunt* dodgeth behind a *bob* must then be made, except the *quarter-hunt* dodgeth there with it, and then not.

2 may be the *half* hunt, and 4 the *quarter* hunt, or others at pleasure.

The Morning Exercise.

Doubles and singles. The treble is the *whole hunt*, and hunteth up into the 2d, 3d and 4th places, lying twice in each; then having made a dodg behind, it lyeth still in the sixth place, and then makes another dodg behind, and so hunts down in the same manner as it hunted up, and then leads four times. When the Treble moves down out of the fifth place, the two hind-bells dodge untill it comes up there again; during which time the bell in the 4th place lieth still. And when the Treble moves up out of the second place, each bell that comes there lieth four times, until the Treble comes down there again. Every *single* is made behind. By this method it will go 120 changes; and by making of *bobs* it will go 240, 360, or 270. At the *bobs* the bell in the 2d place always lieth still.

To ring 240. Every time the *half-hunt* dodgeth behind, a *bob* must then be made, as in this here prickt, where 2 is the *half-hunt*.

The warning for the *bobs* in the 360 and 720, is the same with that in the peal next before: 2 may be the *half-hunt*, and 4 the *quarter-hunt*, or others at pleasure.

The City Delight.

Doubles and Singles. Treble is the *whole-hunt*, and lieth four times before, four times behind, and twice in every other place. When it moves up out of the third place, the *singles* are made in the second and third places until it comes there again, and then behind until it moves up again out of the third place. When it moves down out of the fourth place, the two hind-bells dodg until it comes up there again, during which time the bell in the fourth place lieth still. By this method it will go 120, and by making of *bobs* it will go 240, 360, or 720. At the *bobs* the bell in the second place always lieth still; and the warning for them is the same with that in the two last peals. In the 240 here prickt, 2 is the *half-hunt*; and in the 360 or 720, the 2 and 4 may be the *half* and *quarter-hunts*, or others at pleasure.

London Nightingale.

Doubles and Singles. Treble is the *whole-hunt*, and lieth four times before, four times behind and twice in every other place. When it moves down out of the 5th place, the two hind-bells continue dodging until it comes there again, during which time the bell in the fourth place lieth still. And when the two hind-bells leave dodging then the two first bells dodg

until the hind-bells dodg again, and then they cease. By this method it will go 120; and by making of *bobs* it will go 240, 360, or 720. At the *bobs* the bell in the second place always lyeth still; and the warning for them is the same with that in the preceding peals. In the 240 here prickt, 2 is the *half-hunt*; and in the 360 or 720, the 2 and 4 may be the *half* and *quarter-hunts* or others at pleasure.

The Evening Delight.

Doubles and Singles. Treble is the *whole-hunt* and leads four times, lies behind four times, and twice in every other place, except in the *2d* and *3d* places where it makes a *dodg* every time it hunts up and down. Every other bell hath the same course with the *whole-hunt*; but observing, when they come down and have made a *dodg* in the second and third places, they lie still one change in the second place, and then make another *dodg* there, and so hunt up as the Treble did. But note, when the Treble goeth to lead and leaves leading, the bells in the third and fourth places lie still. Every *single* is made in the second and third places, and every bell lieth four times behind. By this method it will go 120, and by making of *bobs* it will go 240, 360, or 720. At the *bob*-change, the bell in the *4th* place always lieth still.

To ring 240. Every time the *half-hunt* dodgeth in the second and third places a *bob* must then be made, as in this here prickt, where 6 is the *half-hunt*.

To ring 360. Every time the *half* and *quarter-hunts* dodg together in the second and third places, a *bob* must then be made.

To ring 720. Every time the *half-hunt* dodgeth in the 2*d* and 3*d* places a *bob* must then be made, except when the *quarter-hunt* dodgeth there with it, and then not.

In the 360 or 720, the 6 and 5 may be the *half* and *quarter-hunts*, or else 2 and 4, or others at pleasure.

Colledge Doubles.

Treble is the *whole-hunt*, and hath a direct hunting course. When it moves down out of the *5th* place, the two hind-bells dodg until it comes there again; during which time the bell in the fourth place lieth still: but otherwise the five hind-bells have a direct hunting course. By this method it will go *sixty* changes; and by making of *bobs* it will go 120, 180, 360. At the *bob*-changes the bell in the second place always lieth still.

To ring 120. Every time the *half-hunt* dodgeth behind, a *bob* must then be made; as in this here prickt, where 2 is the *half-hunt*.

To ring 180. Every time the *half* and *quarter-hunt* dodg together behind, a *bob* must then be made.

To ring 360. Every time the *half-hunt* dodgeth behind a *bob* must then be made, except when the *quarter-hunt* dodgeth there with it, and then not.

In the 180 or 360, 2 and 4 may be the *half* and *quarter-hunts*, or others at pleasure.

By making of two *extreams* the 360 may be doubled. They are to be made according to the rules in the *Introduction*, page [90](#).

Non-such Bob.

Doubles. Treble is the *whole-hunt*, and hath a direct hunting course. When it moves up out of the third place, the bell that comes there lieth still until the Treble comes down there again; during which time the two first bells dodg. When the Treble leaves the two hind-bells, they dodg until the change wherein the Treble goeth to lead, and then one of them moves down; but as soon as that change is made, the two hind-bells dodg again until the Treble moves up and parts them. Every time the Treble leads, the *double* is made on the four hind-bells throughout the peal. By this method it will go *sixty* changes; and by making of *bobs* it will go 120, 180, or 360. The *bob* is always made at the change wherein the Treble goeth to lead, the two first and two last bells making it.

To ring 120. Every time the *half-hunt* dodgeth before, is a warning for a *bob* to be made the next time the *whole-hunt* goeth to lead; as in this here prickt, where 6 is the *half-hunt*.

To ring 180. Every time the *half* and *quarter-hunts* dodg together before, is a warning for a *bob* to be made when next the Treble goeth to lead.

To ring 360. Every time the *half-hunt* dodgeth before, is a warning for a *bob* to be made the next time the Treble goeth to lead, except the *quarter-hunt* dodgeth there with it, and then not.

In the 180 and 360, the 6 may be the *half-hunt* and 5 the *quarter-hunt*, or others at pleasure.

By making of two *extreams* the 360 may be doubled; they must be made according to the rule in the *Introduction*, page [90](#).

The *bobs* in this peal may also be made at the leadings of the *whole-hunt* as in other peals, and the bell in the fourth place to lie still at every *bob-change*. The warning for them in the 120, 180, and 360 being the same with that in the *Colledge Doubles*, page [143](#).

London Doubles.

The Treble is the *whole-hunt*; and hath a direct hunting course. When it moves down out of the fifth place the two hind-bells dodg until it comes there again, during which time the bell in the fourth place lieth still. When the Treble is behind, the two first bells make a change; but at other times the leading bell lieth still. By this method it will go *sixty* changes, and by making of *bobs* it will go 120, 180, or 360. At the *bob-changes* the bell in the second place always lieth still. The warning for the *bobs* in the 120, 180, and 360, is the same with that in *Colledge Doubles*, p. [143](#). By making of two *extreams* it will go 720. The *extreams* must be made according to the rule in the *Introduction*, page [90](#).

In the 120 here prickt, 2 is the *half-hunt*; and in the 180 and 360, 2 and 4 may be the *half* and *quarter-hunts*, or others at pleasure.

—————	

These six peals will each of them go *sixty* changes without any *bob*, and by making of *bobs* each of them will go 120, 180, and 360. In three of them, viz. *Triples Doubles* and *Singles*, *Single bob*, and *City bob*, at the *bob-changes* the bell in the fourth place always lyeth still; whereas at the rest of the changes which are made at the leadings of the *whole-hunt*, the bell in the second place lieth still. And in the other three peals, viz. *Triples doubles and singles dodging behind*, *Doubles and Triples*, and *London Bob*, at the

bob-changes the bell in the second place always lieth still, whereas at the rest of the changes that are made at the leadings of the *whole-hunt*, the bell in the fourth place lieth still. The warning for the *bobs* in the 120, 180, and 360, in each of these six peals is the same with that in the 120, 180, and 360 in *Colledge Doubles*, p. [143](#). Each of these peals will go 720 with two *extreams*, which must be made according to the rule in the *Introduction*, page [90](#).

In the 120 of each there prickt, viz., in *City Bob*, *London Bob*, and *Triples doubles* and *singles*, the 2 is the *half-hunt*, and in the other three peals the 3 is the *half-hunt*.

In the 180 and 360 of each peal, the 2 and 4 may be the *half* and *quarter-hunts*, or others at pleasure.

New Bob.

Triples and Doubles. The general method of this Peal is the same with *Grandsire Bob*, and the *bobs* also made as in that peal. It will go 120, 180, or 240, and by making of two *extreams* it will go 360 or 480; and with six *singles* it will go 720.

To ring 120. Every time the *half-hunt* dodgeth behind a *bob* must then be made.

To ring 180. Every time the *half* and *quarter-hunt* dodg together behind, a *bob* must then be made; and by making of two *extreams* it will go 360. The first *extream* may be made at the first, second, or third *bob*; observing to make the second *extream* at the third following *bob* from the first *extream*, where the *singles* in both must be made behind.

To ring 720. The *bobs* throughout the peal are made by the same rule as in the 120, but farther observing, when the *whole* and *half-hunts* come together before, if the *quarter-hunt* lieth either in the third or fourth places, then a *single* must be made betwixt the two next *extream* bells to the *quarter-hunt*.

The 2 may be the *half-hunt* and 4 the *quarter-hunt*, or others at pleasure.

Colledge Little Bob, dodging behind.

Triples and Doubles. The Treble is the *whole-hunt*, and hath a direct hunting course. When it moves down out of the fifth place, the two hind-bells dodg until it comes there again. All the bells have a direct hunting course, but observing, that when any bell moves up into the fourth place, if the Treble is then any where below it, it lies there twice, and then moves down again. By this method it will go *sixty* changes; and by making of *bobs* it will go 120, 180, or 360. At every *bob-change* the bell in the second place lieth still. The warning for the *bobs* is the same with that in *Colledge Doubles*, page [143](#). And the two *extreams* in the 720 must be made according to the rule in the *Introduction*, page [90](#).

In the 120 here prickt, 3 is the *half-hunt*; and in the 180 or 360, 2 and 4 may be the *half* and *quarter-hunts*, or others at pleasure.

This peal in practice will be found very plain and easie, and also good Musick.

Colledge Little Bob, dodging before and behind.

Triples and Doubles. The Treble hath a direct hunting course, and when it moves up out of the second place, the two first bells dodg until it comes there again; and also when it moves down out of the 5th place, the two hind-bells dodg until it comes there again. Every bell that moves up into the fourth place, if the Treble is any where below it, lies there twice and then hunts down; and also every bell that moves down into the third place, if the Treble is any where above it, lieth there twice, and then hunts up behind. By this method it will go sixty changes, and by making of *bobs* it will go 120, 180, or 360. At every *bob-change* the bell in the second place lieth still. The 2 is the *half-hunt* in the 120 here prickt, and 2 and 4 may be the *half* and *quarter-hunts* in the 120 and 360, or others at pleasure.

Court Bob.

Triples and *Doubles*. The Treble hath a direct hunting course. Every bell that comes before and behind makes a *Dodg*, then lieth still, and so moves away, except the bell that lieth still behind when the treble leads, and also that bell which leads when the Treble lieth behind, both which do dodg before and after their lying still, and then move away. When the treble leads and lieth behind, the *double* is made on the four middle bells. By this method it will go *sixty* changes; and with *bobs* it will go 120, 180, or 360. At the *bob-changes* the bell in the fourth place lieth still.

To ring 120. Every time the *half-hunt* maketh a change next the *whole-hunt*, a *bob* must then be made, as in this here prickt, where 2 is the *half-hunt*.

To ring 180. Every time the *half* and *quarter-hunts* make a change together next the *whole-hunt*, a *bob* must then be made.

To ring 360. Every time the *half-hunt* maketh a change next the *whole-hunt* a *bob* must then be made, except when a *quarter-hunt* makes a change

there with it, and then not.

In the 180 and 360 2 and 4 may be the *half* and *quarter-hunts* or others at pleasure. The two *extreams* in the 720 must be made according to the rule in the *Introduction*. The first *extream* may be made either first, second, or third time that the *half* and *quarter-hunts* make a change together in the second and third places at the leading of the *whole-hunt*; and then the second *extream* must be made the third time following that those two bells make a change there again, the *extreams* being there made in the fourth and fifth places, and the *singles* in the second and third places.

Every time the Treble leads, the *double* may as well be made on the four hind-bells, and the *bobs* to be made as before; but the warning for them the same with *Colledge Doubles*.

Five Colledge Bobs.

In these five peals, the Treble is the *whole-hunt*, and hath a like dodging course in all of them. The general method of the five peals is as follows: viz.

Colledge Bob the first. When the Treble moves down out of the fifth place, the two hind bells dodg until it comes there again. Every bell leads twice, and then hunts up into the fourth place, unless the dodging course of the Treble hinders it, where it lieth twice and then moves down again; except the bell that dodged with the Treble before, and also that which leads when the Treble lieth still behind, both which hunt directly up. When the Treble moves down from dodging in the third and fourth places, the bell that dodged there with it continues in those two places, lying twice together in each by turns until the Treble comes to dodg there with it again.

Colledge Bob the second. Every bell when it comes to lead makes a dodg before, then it lyeth still one change, then it makes another dodg, and so moves up into the fourth place where it lieth still twice, and then down again; except it dodgeth with the Treble in the fourth place, and then it hunts up behind. But when the Treble moves down out of the third place, the two bells in the third and fourth places continue there until the Treble comes up there again, during which time the two hind-bells dodg.

Colledge Bob the third. When the Treble leaves leading, the two first bells dodg until it comes to lead again; except when the Treble dodgeth behind, for then the two first bells lie still. When the Treble leaves the two hind-bells, they lie still one change, dodg the next, and so by turns until the treble comes there again. The two middle bells always dodg until the Treble hindereth them.

Colledge Bob the First.

Colledge Bob the fifth. When the Treble leaves the two hind bells, they dodg until it comes there again. And when it leaves the two first bells they

lie still one change, dodg the next, and so by turns until it comes down there again; during which time the bells in the third and fourth places dodg except when the Treble hindereth them.

By these methods each of them will go 120 changes, and by making of *bobs* they will go 240, 360, or 720. In the first of them the bell in the second place lieth still at the *bob*-changes, and in the other four the bell in the fourth place always lieth still.

To ring 240. Every time the *half-hunt* dodgeth behind a *bob* must then be made, as in these peals here prickt; where, in the first peal the 4 is the *half-hunt*, and in the other four peals the 2 is the *half-hunt*.

To ring 360. Every time the *half* and *quarter-hunts* dodg together behind, a *bob* must then be made.

To ring 720. Every time the *half-hunt* dodgeth behind a *bob* must then be made, except when the *quarter-hunt* dodgeth there with it, and then not.

In the 360 or 720 of each peal the 2 may be the *half-hunt*, and 4 the *quarter-hunt* or others at pleasure.

The Experiment.

Triples and Doubles. The Treble is the *whole-hunt*, but never hunteth up farther than the fourth place, for the four first bells go *Doubles and Singles*; and every time the Treble leads an *extream* is made in the third and fourth places, according to the common course of *doubles* and *singles* upon, four bells; which course of *doubles* and *singles* must be continued, the two hind bells in the mean time dodging, until the making of the first *Parting* change, which will separate the two hind bells; and then the four first bells go the same course of *doubles* and *singles* again, the two hind bells dodging as before, until the making of the second *Parting* change, and so successively. The *Parting* change is a *double* change on the four middle bells, and made at the leading of the Treble. The first *Parting* change may be made either at the first second or third leading of the *Treble*, observing, that whatsoever bell in the first *Parting* change moves down to the Treble, when the Treble leads and that bell lieth next it again, the second *Parting* change must then be made. And whatsoever bell in the second *Parting* change moves down to the Treble when the Treble leads, and that bell lieth

next it again, the third *Parting* change must then be made, and so successively. There being five *Parting* changes in the Peal, and as many *half-hunts*, each of the bells (the Treble excepted) taking that place one after another; and consequently, the five persons that ring them must call the *Parting* changes one after another as their turn comes, according to the aforesaid rule.

Changes upon Seven Bells.

The methods upon *five* may be prickt upon *seven*, observing but the true difference of proportion in the changes; that is, *doubles* upon *five* bells must be *triples* upon *seven*; *doubles* and *singles* upon *five* must be *triples* and *doubles* upon *seven*, &c.

Plain Triples.

All the bells have a direct hunting course. All peals upon *six* bells wherein half the changes are *triples*, will go upon *seven* according to this method here prickt; two of the changes upon *six* being always made at the leadings of the Treble, the six hindmost bells making them: the first is a *triple* change brought in by the course of the bells, and the next must either be *double* or *single* according to the method of the changes upon *six*.

6473521	

Every time the Treble leaves leading, the bell in the third place lieth still, whilst the four hind bells dodg; but otherwise all the bells have a direct hunting course as Plain *Triples*. By this method it will go *seventy* changes, and by making of *bobs* it will go 350. The rule for the *bobs* is this; when the Treble goeth to lead, if the *half-hunt* lying before gives it place, then a *bob* must be made at that change, wherein the bell in the third place lieth still, and the four hind bells dodg; so that at every *bob* the four hind bells make two dodges before they part. By making of two *extreams* it will go 700, and with four *extreams* it will go 1400. But by making of intervening *bobs* it

will go 700 compleat *triples* without any *extream*; 1400 with two *extreams*, and 2800 with four *extreams*. Any bell may be made a *half-hunt*.

Colledge Bob, Triples: the second way.

4251376	4276135	4176235	
2453167	2471653	4712653	
4235617	4217635	7421635	

Each of these two peals by the method here prickt will go *Eighty four* changes; and then when the Treble leads, and the *half-hunt* lieth next it, a *Parting* change being then made, they will go 420. And by making of *bobs* they will go 5040. 2 may be the *half-hunt*, or any other at pleasure. The *Parting* change is a *double* on the four middlemost of the six hind bells.

'Tis plainly demonstrable, that the *Principle* upon *five* may go 420 *triples* upon *seven*, which is a twelfth part; 840, which is a sixth part; or 1260, which is a fourth part of the whole, and the utmost period of *triple* changes. And then by making of four *extreams* it may go 5040, the compleat peal.

Great variety of peals may be prickt upon seven: as *Triples, Triples and Doubles, Triples Doubles and Singles; Doubles, Doubles and Singles, &c.* But changes upon *seven* being seldom practised, I will therefore forbear to wast more paper in pricking down examples, and proceed to the changes on *eight*.

Changes upon Eight Bells.

Sixscores upon *five* bells are commonly rung upon *eight*, three bells lying behind. The most musical to lie behind are 218, 418, 148, 248, 348, 468, 648, 548, 864, 241, 321, and 135 to be laid behind, and then 1 and 3 to dodg throughout the peal. And also 184 to be laid behind, and to go the six changes thus, 814. 841. 481. 418. 148. 184. 814. &c. and so on to the end of the *sixscore*. They may go the *sixes* either at whole or half-pulls. Peals upon *six*, as *Triples* and *Doubles*, &c. make exceeding good musick upon *Eight*, 48. 68. 41. or 18. lying behind. Or else *Triples* and *doubles* upon the six middle bells, the Treble leading, and the Tenor lying behind. And also *Triples* upon *seven*, the Tenor lying behind. But for such as have not yet attain'd the skill to ring these compleat peals, *Sett-changes* are very proper for them, being easie and rung with little difficulty.

Colledge Grounds.

The *grounds* of these *sett-changes* are of two kinds. First, placing of the bells *Fifths*, or secondly *Thirds*. To place them *fifths*; the 4 must hunt up behind the 7, the 3 behind the 6, and the 2 behind the 5. Or else the 5 may hunt down under the 2, the 6 under 3, and the 7 under 4. Or otherwise, first a *single*, then a *double*, and then a *triple* change to be made on the middlemost bells, all which are to one effect; for then the bells will lie *fifths* thus, 15. 26. 37. 48. Here are four *Concords* to be chiefly regarded in the peal. The first is 15. the second 26. the third 37. and the fourth is 48. These four *Concords* may go the methods of any changes upon four bells; 1.5 being taken for the Treble, 2.6 for the Second, 3.7 for the Third, and 4.8 for the Fourth; and the *Concords* to change places with each other at pleasure. Wherein 'tis observable, that the two notes of every *Concord* must constantly attend each other in their motion; that is, whensoever one of the two notes moves, the other must follow it. For example: admit they were to go the *twenty four* changes, and that 1.5 were to hunt up over 2.6, 3.7, and 4.8. first therefore it must move up over 2.6, wherein it makes four changes: for first, the 5 moves up over the 2 thus, 12563748, the 1 must follow it

thus, 2156.37.48. Then the 5 moves up over 6. 2165.37.48. the 1 follows it again 26.15.37.48; here the two *Concords* have made a change. In which manner also 1.5 must move up over 3.7. and 4.8. And in this manner are the *Concords* to move and change places with each other throughout the peal. Or secondly, to place the bells *thirds*, the 64 and 2 must hunt up, or else the 357 down; or otherwise a *triple*, a *double*, and a *single* change to be made on the middlemost bells; all which are to one and the same effect, for then the bells will lie *thirds* thus, 13.57.24.68. Here are also four *Concords* principally to be regarded in the peal: the first is 1.3, the second 5.7, the third 2.4, and the fourth 6.8. These four *Concords* may also go the methods of any changes upon four bells, 1.3 being taken for the *treble*, 5.7 for *second*, 2.4 for the *third*, and 6.8 for the *fourth*, and they must move in the same manner as before I have shewed. By these *Grounds* great variety of excellent and Musical changes are to be rung. If they go the *twenty four*, then the peal will consist of four times that number, that is, *ninety six* changes. But they may go only the first eight changes of the *twenty four*, and then the peal will consist of *thirty two*. Or else the first eight changes of a *twenty four* doubles and Singles, which will consist of *forty eight* if the double changes of the *twenty four* are singled, otherwise but *thirty two* as before. Any *Concord* may be made a *hunt* and to move either up or down at the beginning: so that these *Grounds* afford great diversity. In the ringing of these *Sett-changes* the notes will lie sometimes *fifths*, sometimes *thirds*, and sometimes *thirds* and *fifths*, and then 'tis pleasant Musick to *Clam* them, that is, the two notes of each *Concord* to strike together; and if they are *clam'd* true, the eight bells will strike as if they were but four, but with far greater harmony. They may *Clam* two or three bouts, and then strike open as many, and so alternately; or else they may *Clam* one pull, open the next, and so on. To reduce the notes of the *fifths* to their right places again at the conclusion of the peal, either 234 must hunt down, or else 765 up; or otherwise a *Triple double* and *single* change to be made on the middlemost bells, all which are to one effect, and will bring the bells round. To reduce the *thirds* either move down 246 into their places, or else move up 753 into theirs; or otherwise make *single*, *double*, and *triple* change on the middlemost bells; all which are to one effect, and will bring the bells again round.

The methods of all peals upon six bells may be prickt upon *eight*, observing but proportion in the changes, according to the difference in the number of bells, viz. *Triples* and *doubles* upon six must be *quadruples* and *triples* upon *eight*. *Doubles* upon six must be *Triples* upon *eight*, &c.

13254768
13527486

Plain Quadruples and Triples. All the bells have a direct hunting course until the Treble leads, and then the six hindmost bells dodg. By this method it will go 112. And by making of *bobs* it will go 224, 336, or 672. The *bob* is a *triple* change at the leading of the Treble, wherein the bell in the 4th place lieth still.

To ring 224. Every time the *half-hunt* dodgeth behind, a *bob* must then be made.

To ring 336. Every time the *half* and *quarter-hunts* dodg together behind, a *bob* must then be made.

To ring 672. Every time the *half-hunt* dodgeth behind, a *bob* must then be made, except when the *quarter-hunt* dodgeth there with it, and then not. The 2 may be the *half-hunt*, and 4 the *quarter-hunt*, or others at pleasure.

By making of two *extreams* it will go 1344, and with four *extreams* it will go 2688.

All peals upon *six* bells wherein half the changes are *triples*, will go upon *eight* according to the method before prickt, but after this manner. If it is a peal upon *six*, which consists of 360 or 720 changes, then in the ringing of it upon *eight* there must be five *hunts*. The Treble may be the first *hunt*; 2 the second &c. Now the method of the peal must go on according to that before prickt until the Treble leads, and the 2 lie next it, and then two of the changes upon *six* are always made, the six hind bells making them: the first is always a *triple* change brought in by the course of the bells thus, 12436587, and the second either *double* or *single* according to the method upon *six*; and the *third fourth* and *fifth* Hunts in eight, are the *whole half* and *quarter-hunts* in the changes upon *six*. By this method it will go 40320 compleat, but then every *112th* change will be a *double*, and sometimes *single* in some peals. The bells may be brought round at 672 in some peals, but in others not till 1344.

Colledge Bob-Major.

Quadruples and Triples. The *first* hath single dodging behind; the *second* single dodging before and behind; the *third* double dodging behind; and the *fourth* double dodging before and behind. It may also be prickt a *fifth* way, viz. with single dodging before, and double dodging behind. And likewise a *sixth* way, viz. with doubled dodging before, and single dodging behind. The dodging is without intermission except when Treble hindreth, and also betwixt two bells until Treble parts them. By this method each of them will go 112, and by making of *bobs* they will go 224, 336, or 672. The *bobs* are *triple* changes at the leadings of the Treble; in the *first second* and *sixth* the bell in the *4th* place lieth still at the *bobs*, and in the *third fourth* and *fifth* the bell in the *2d* place lieth still. The warning for the *bobs* is the same with that in *Bob-major* next before. And the *extreams* made as in that peal, 2 may be the *half* and 4 the *quarter-hunt* in the four first, or others at pleasure.

Colledge Triples, dodging before and behind.

Triples. The *fourth* bell must first hunt up into the *7th* place and then the 4 and 8 continually dodg behind throughout the peal, except when the Treble hindreth them. The bell that moves up into the *6th* place when the Treble moves down from thence, lieth still there until the Treble displaceth it; during which time the two hind bells dodg, and the five first go a perfect hunting course. And also when the Treble moves up out of the *5th* place, the five first bells go a hunting course until it comes down there again. By this method it will go *eighty* changes, and by making of *bobs* it will go 160, 240, or 480. The *bob* is a *triple* change at the leading of the Treble, wherein the bell in the *4th* place lieth still.

To ring 160. Every time the *half-hunt* maketh a change in the *2d* and *3d* places, a *bob* must at the same time be made.

To ring 240. Every time the *half* and *quarter-hunts* make a change together in the second and third places, a *bob* must then be made.

To ring 480. Every time the *half-hunt* maketh a change in the second and third places, a *bob* must then be made, except when the *quarter-hunt* makes a change there with it, and then not. The 2 may be the *half-hunt*, and 6 the *quarter-hunt*, or others at pleasure.

63254718	63214875

The method of ringing this peal is the same in all respects with that next before, with this only difference. Every time the *whole-hunt* leads, the *triple* change is here made on the six middle bells, which parts the two hind-bells, and so introduceth them by degrees into the body of the peal. By this method it will go 112, and by making of *bobs* it will go 224, 336, or 672. The *bob* is a *triple* change at the leading of the Treble, wherein the bell in the 6th place lieth still. The warning for the *bobs* in the 224 is the same with that in the 160 next before. In the 336 'tis the same with that in the 240 next before. And in the 672 'tis the same with that in the 480 next before. 2 may be the *half-hunt* and 5 the *quarter-hunt*, or others at pleasure.

The Grand Experiment.

Quadruples and Triples. The Treble is the *whole-hunt*, but never hunteth up farther than the sixth place; for the six first bells go *triples* and *doubles*, it matters not of what sort, provided that the *double* changes at the leadings of the Treble are always made on the four hindmost of the six bells; which course of *triples* and *doubles* must be continued, the two hindmost of the eight bells in the mean time dodging until the first *Parting* change is made, which will separate the two hindmost bells; and then the six first bells go the same course of *triples* and *doubles* again, the two hindmost bells in the mean time dodging as before, until the second *Parting* change is made, and so successively. The *Parting* change is a *triple* change on the six middle bells, and made at the leadings of the *whole-hunt*. The first *Parting* change may be made either at the first second third fourth or

fifth leading of the Treble; observing, that whatsoever bell in the first *Parting* change moves down to the Treble, when the Treble leads and that bell lieth next it again, the second *Parting* change must then be made. And again, whatsoever bell in the second *Parting* change moves down to the Treble, when the Treble leads and that bell lieth next it again, the third *Parting* change must then be made, and so successively; there being seven *Parting* changes in the peal, and as many *half-hunts*, each of the seven bells taking that place one after another. So that the seven persons that ring the 2d, 3d, 4th, 5th, 6th, and 7th bells, must call the *Parting* changes one after another, according as the aforesaid rule directs them: or else he that rings the Treble may do it, but not so well as the rest. To ring it with such peals upon six bells which consist of single courses, it will go 420; with double courses 840. This peal may also be rung *triples*, that is, the six first bells to go *doubles*, the two hind bells in the mean time dodging, and the *Parting* changes to be made as before. But in ringing it with such Peals of *Triples* and *Doubles*, or else *Doubles* upon six bells, where the *double* change at every leading of the Treble is made in the 2d 3d 5th and 6th places, there, whatsoever two bells lie next the Treble at the first *Parting* change, the same two bells will lie next it at every *Parting* change, which will be a rule for calling them, there being only five *Parting* changes in it, which are *triples* as before. The first *Parting* change may also here be made either the first second third fourth or fifth time the Treble leads. If it is rung with peals upon six bells, consisting of single Courses, it will then go 300, with double Courses 600. This peal may also be rung by *Concatenating* of divers kinds of methods. For as the peal consists of several parts, viz. from one *Parting* change to the next, being accounted a compleat part; so each part may be rung by a different method from the rest. For any peals upon six bells, whether *doubles*, or *triples and doubles*, consisting either of single or double Courses, may indifferently be rung together in this peal, succeeding each other in the several parts of it, and at every *Parting* change a new method to begin. Or else any two of them to succeed each other alternately throughout the parts of the peal, or more or less at pleasure. But still observing, that all that are rung together in one peal must be such, where the *doubles* at the leadings of the Treble are made on the four hindmost of the six bells; or else all of them such, where the *doubles* at the leadings of the Treble are made in the second and third, and the fifth and sixth places. If they are of the first kind, then there will be seven *Parting* changes in the

peal, and as many *half-hunts*; and the *half-hunts* must successively call the *Parting* changes as before I have shewed: if of the later kind, then but five *Parting* changes, which must be call'd by the same rule as before I have shewed in ringing it with one peal of this kind. And also observing, if the first *Parting* change is made at the first second third or fourth leading of the Treble, then whatsoever method it goes at first, it must also go the same again after the last *Parting* change is made. But in ringing it with peals of the first kind, the second being made the first *half-hunt*, and to call the first *Parting* change; and with peals of the later, the *3d* likewise: then the last *Parting* change in either of them will conclude the peal.

This peal may go the method of the *Experiment* upon six bells, [page 162](#), that is, the four first bells to go the *Twenty four* Doubles and Singles as in that peal; and the four hindmost bells in the mean time to dodg double. The *Parting* changes are *triples* on the middle bells, and the same rules observed in making and calling them, as in that peal: but here are seven of them in this, and 168 changes.

The *Experiment* upon six may also be rung *Comprehensively* herein. The six first bells to go that compleat peal, the two hindmost of the eight bells in the mean time dodging; and every time the *3d* bell comes to call the *Parting* change on six, then instead of it a *Grand* change must be made, that is, a *triple* on the six middle bells: and then the six first bells to go the compleat peal again, the two hindmost bells in the mean time dodging as before, untill the third bell calls another *Grand* change, and so successively; there being three of them in the peal, and 360 changes. If the bells are placed 23567148 at the beginning, the 4.8 will dodg behind the first *sixscore* of it, 4.1 the second, and 1.8 the third, and then the *5th* may call the *Grand* changes in the place of the *3d*; or any other three bells may be laid behind at first, for the sake of Musical dodging. The first *Grand* change may be made either at the first second third fourth or fifth *Parting* change, observing, that whatsoever bell at the first *Grand* change should then in course have call'd a *Parting* change, every time that bell comes to call a *Parting* change, it must call a *Grand* change in the place of it: or else any one of the six first bells (the *whole-hunt* excepted) may be appointed beforehand to attend the calling of the *Grand* changes, observing, that every time that bell comes to call a *Parting* change, a *Grand* change must be call'd in the place of it.

Imperial Bob.

Quadruples and Triples. The Treble hath a dodging course. The two first and two last bells always dodg until the Treble hindreth them, and in the mean time the two next bells to those dodging bells do lie still one change, dodg the next, and so by turns until the Treble also hindreth them. And the two bells in the fifth and sixth places whilst the Treble is behind, and those in the 3^d and 4th places when 'tis before dodg, until Treble likewise hindreth them. By this method it will go 224, and by making of *bobs* it will go 448, 672, or 1344. The *bob* is a *triple* change at the leading of the Treble, wherein the bell in the fourth place lieth still.

The Changes are plain *Trebles* and *Doubles* until the Treble leads, and then a *single* change is always made. The Peal called *Old Doubles and Singles* upon five bells is the ground of this Peal, every *single* in this peal being the *single* in that. For as in that peal the *whole-hunt* is one of the two bells that make every *single*; so likewise in this, the 6 being the *half-hunt*, is one of the two bells that makes every *single* change herein, except when it lieth next the *whole-hunt*, and then the *single* is behind; but when 2 lieth also next the 6, then *extream* in the fourth and fifth places.

Nottingham *Trebles and Doubles*.

The ordinary course is to move directly, except when the *whole-hunt* passes either out of or into the *second's* place, and then constantly dodg behind. There are single and double *bobs*; the *bob* is a *double* change at the leading of the Treble, wherein the bell in the *4th* place lieth still. When the third *hunt* dodges behind, the second *hunt* then leading, is a warning for the single *bob* to be made at the next leading of the Treble. And when the second and third *hunts* dodg together behind, is a warning for the double *bob* to be made at the two next leadings of the Treble. The two *extreams* in the 720 must be made according to the general rule in the *Introduction*, p. [90](#).

One time the Treble hunts quite up, the next time only up into the fourth place, and so by turns, as in the example here prickt. The bells observe the course of the Treble, and also dodg it being before; and once in 120 changes *bob*, when that bell which is nominated for the second *hunt* lying behind twice, meets with the third *hunt* when the first *hunt* is going to lead. The second and third *hunts* are both one.

243651	461235
426315	

When the Treble leaves the two first bells, they dodg until it comes there again; but in all other respects 'tis the same with the former. And the *singles* in the 120, 240, 360, and 720, to be made as in that Peal.

Oxford Single Bob.

The method of this Peal is the same in all respects with *Oxford Single Bob, Triples Doubles and Singles*, excepting the *bobs* in this peal, which are made in stead of the *singles* in that. By making of *bobs* it will go 180 or 360. The *bob* is a *double* change at the leading of the Treble, wherein the bell in the fourth place lieth still.

To ring 180, there must be a *whole* and *half-hunt*; and when the *whole-hunt* is before and the *half-hunt* behind, the next change is to be a *bob*.

To ring 360, there must be a *whole*, *half*, and *quarter-hunt*, viz.

First, when the *whole-hunt* comes to lead, and the *half-hunt* to fall behind, the next change is a *bob*: and

Secondly, when the *whole-hunt* leads before the *quarter-hunt*, and the *half-hunt* is in the fifth place, the next change is also a *bob*.

The 1 and 5 may be the *whole* and *half-hunts* in the 180, and 1.5.3 the *whole*, *half*, and *quarter-hunts* in the 360, or others at pleasure.

Oxford Double Bob.

The method of this peal is the same in all respects with *Oxford double Bob* before, excepting the *bobs* in this peal, which are made instead of the *singles* in that. The *bobs* are here made in the same manner, and call'd by the same rule in the 180 and 360, as in *Oxford single Bob* next before; and the two *extreams* in the 720, both in this and the last peal, must be made according to the general rule in the *Introduction*.

Oxford *Triple Bob*.

The Treble is the *whole-hunt*, and hath a dodging course. When it leaves the two hind bells, they dodg until it leads, and then a *double* is made on the four middle bells, which parts the two hind bells; but then the two hind bells dodg again until the Treble displaceth them. Every bell leads twice (except when the Treble dodgeth there) and as they hunt up and down

do make a dodg in the third and *4th* places. When the Treble moves up from dodging before, the bell that dodged there with it continues in the first and *2d* places, lying twice together in each, until the Treble comes down to dodg there with it again. By this method it will go 120, and by making of *bobs* it will go 360. At the *bobs* the bell in the fourth place lieth still. The warning for them is this, When the *half-hunt* leads, and the Treble moves down, and dodgeth there with it, a *bob* must then be made at that leading of the Treble. The 3 may be the *half-hunt*, or any other.

Oxford Triple Bob, the second way.

32145	45321	12453

In this peal there is a *whole-hunt* and an *half-hunt*. The *whole-hunt* lieth always four times before, and four times behind, and twice in every other place. The two hindmost bells always dodg 'till the *whole-hunt* hindreth, except when the *whole-hunt* is before, at which time there are four changes made of a four and twenty *doubles* and *singles*; the first of which is a double change brought in by the course of the bells (as in the following peal appeareth) 13254; the second is a *single* in the third and fourth places (13524); the third is a *double* on the four last (15342), and the fourth a *single* again in the third and fourth places (15432), except when the *half-hunt* is with the *whole-hunt* before, then it is to be an *extream* behind. When the *whole-hunt* leaves the *third's* place hunting up, the two formost bells dodg till it returns into the same place again.

The Whirligigge. 1 and 5.

In this peal, first the bells dodg behind (and not before) till the *whole-hunt* hindreth them; and the next course they dodg in like manner before (and not behind) till the *whole-hunt* hindreth them; and so by turns throughout the whole peal. When the *whole-hunt* is before, if the bells were dodging behind before it came to lead, single behind; if they were dodging before, single in *second's* and *third's* place; and when the *whole-hunt* leads, and *half-hunt* is in *Tenor's* place, there is always an *extream* to be made in *3d* and *4th* place, which is every fourth time the *whole-hunt* leads.

In this peal the bells always dodg both before and behind, till the *whole-hunt* hindreth them; except when both the Hunts are together either before or behind; for then the two farthest bells from the Hunts do leave dodging for the next change onely which is always a *double* made by the two Hunts and the two next bells to them. The *singles* and *extreams* are made as in the *Old Doubles*.

Winwick Doubles. 1 and 3.

In this peal, first, the two hindmost bells dodg till the *whole-hunt* hindreth them, till the first *single* is made: and then the two formost bells dodg 'till the *whole-hunt* hindreth them, until there be made another *single*, and so they continually dodg successively throughout the whole peal. There are six *singles* which are made in the same manner as in St. *Dunstan's Doubles*, page [127](#).

Non-such. 1 and 2.

In this peal the bells always dodg both behind and before till the *whole-hunt* hindreth them, except when both the Hunts are together either behind or before: for then the bells omit dodging for the next change, as in *Jack-on-both-sides*. There are four *singles* which are all made in the 3d and 4th places every third time that the *whole-hunt* leads.

Cambridg *Delight. 2 and 4.*

In this peal the two hindmost bells always dodg till the *whole-hunt* hinders them. When the *whole-hunt* leaves the *thirds* place hunting up, the two foremost bells dodg till the *half-hunt* hinders them, whose course is the same with the course of the *half-hunt* in *Grandsire*. There are two *singles* which are made by the same rule as in *Grandsire*.

In this peal the two hindmost bells always dodg till the *whole-hunt* hinders, as in the former Peal. When the *half-hunt* leaves the *3ds* place hunting up, the two foremost bells dodg till the *whole-hunt* hinders. It differeth from the former peal in this; That whereas in that the bells always begin to dodg before when the *whole-hunt* leaves *third's* place, and are parted by the *half-hunt*; in this they begin to dodg before when the *half-hunt* leaves the *third's* place, and are parted as well before as behind by the *whole-hunt*. It differeth also, in that the *half-hunt* in this peal always

bobbeth behind on the contrary stroke to what it doth in the former peal;
there are two *singles*, which are made as in the former peal.

The Dream, upon five bells. 1 and 2.

In this peal the two hindmost bells always dodg till the *whole-hunt* hinders, except when the two Hunts are together before. Or it may be rang by making the two foremost bells dodg always, except the Hunts be together behind. There are six single changes which are all behind every other time the *whole-hunt* leads, the *half-hunt* at every *single* lying either in the *2d* or *3ds* places.

The Cheat. 1 and 3.

In this peal the two hindmost bells always dodg 'till the *whole-hunt* hinders, and the two foremost bells dodg 'till either the *whole* or *half-hunt* hinders. Or on the contrary, the two foremost bells may dodg 'till the *whole-hunt* hinder, and the two hindmost 'till either the *whole-hunt* or *half-hunt* hinder. Or it may be rang a third way, by joining both these courses together, ringing twenty changes of it one way, and the next twenty changes the other way throughout the peal. There are six *singles* which are all made behind, every second time the *whole-hunt* leads; or at pleasure it may be rang with twelve *singles*, which are likewise all made behind.

In this peal every change is a jumping change (in which one bell leaps over two bells at once,) except when the Treble is either behind or before, for then there is always a plain *double* change made, or else a *single* at the end of each sixty changes. Treble is a perfect Hunt; the two foremost bells always dodg until the Treble hinder. When the Treble is hunting up, the jumping changes are all made by the bell in the Tenor's place, jumping into *third's*, except only that one when Treble goeth out of *second's* place into *third's*; for then the bell in the *3ds* place jumps into Trebles, where it dodgeth with the bell in the *2ds* place till Treble hinder. When Treble is hunting down every jumping change is made by the bell in the *3ds* place jumping into Tenor's, except when it goeth out of *third's* place into *second's*, for then the bell in Treble's place jumps into *3ds*. And observe always, that when Treble is going to lead the first time, the bell in Tenor's place jumps into *third's*, and the next time the bell in the *third's* place into Tenor's throughout the peal. There are two *singles* which are made, as in *Grandsire*.

Jumping Doubles dodging behind.

In this peal Treble is a perfect Hunt, as in the former. The two hindmost bells always dodg till Treble hinders. When Treble is hunting up the bell in *thirds* place always jumps into Treble's, excepting only when Treble goeth out of *third's* place into *fourth's*; for then the bell in Tenor's place jumps into *3ds*. And observe, that every second time the Treble goeth out of *4th* into *5ths* place, the bell in Treble's place jumps into *3ds*; whereas at other times at the same change the bell in *3ds* place jumps into Treble's. When Treble leaves the *5ths* place hunting down, the bell in the *3ds* place jumps into Treble's; when she leaves *4ths* place the bell in *3ds* place jumps into Tenor's. When she is either in the *2d* or *3ds* places hunting down, the bell in the Treble's place jumps into *3ds*. There are two *singles* made, as in the former Peal.

Symphonie, upon six bells. 1. 2. and 3.

In this peal are 720 changes, all *doubles* except twelve *singles*, which are made as in plain *Trebles and Doubles* on six bells. The two hindmost bells always dodg till the *whole-hunt* hinders them, except when a *single* is made in the *4th* and *5th* places. When the *whole-hunt* leaves the *4ths* place hunting up, the two foremost bells dodg till it leaves the same place again hunting down: but it may be rang at pleasure to make the bells dodg perpetually before as well as behind, by making in every twelve changes two Trebles, one of them when the *whole-hunt* leaves the *3ds* place hunting up, and the other when it leaves the *4ths* place hunting down; so that there will be in the whole peal Sixscore *Treble-changes*. When the *whole-hunt* is behind, the four foremost bells dodg; when the *whole-hunt* is before, the four hindmost dodg.

Grandsire upon Symphonie. 1. 2. and 6.

This peal of *Symphonie* may be rang with but two single or two treble changes at the end of either *Eightenscore*, by ringing it with single and double *bobs* as in *Grandsire Bob*. The rule for calling the *bobs* in this peal is the very same as in *Grandsire Bob*, but when the *bob*-changes are to be made, the Hunts do not lie in the same order as in *Grandsire Bob*; for in this peal at a single *bob* the *whole-hunt* leads, the *half-hunt* in the 5th place, and the *quarter-hunt* in the 4th place. And at the first *bob* of a double *bob* the *half-hunt* is in Tenor's place, and *quarter-hunt* in 2ds place; and at the later *bob* the *half-hunt* is in the 5th place, and *quarter-hunt* in 2ds place, just contrary to what it is in *Grandsire Bob*. I have prickt this peal with two Treble changes in every twelve; so that if you make two Trebles more at the end of either *Eightenscore* (which must be made when the *whole-hunt* is going to lead just two changes sooner than if you should have made a *single*) there will then be in the whole 720 just Sixscore and two Treble changes.

		<i>bob.</i>		

This peal is taken out of the *Dream upon five bells*. Every time the *whole-hunt* is before, there being two changes of that peal made in this. Every bell is a perfect Hunt, when the *whole-hunt* is before dodg on the four hindmost, except the *half-hunt* be either in the 5th or Tenor's place, then always *bob* as in *Grandsire Bob*, except the *quarter-hunt* lieth next to the *half-hunt*, for then it is always to be a dodg on the four hindmost. Every other time that the *whole-hunt* and *half-hunt* come together before, there is *single* which is always made behind.

A Twelvescore Trebles and Doubles. upon Six Bells.

The Treble hath a constant dodging course; and when it leaves the two hind bells, they dodg until it comes there again, except when the Treble dodgeth before, and then they lie still. The two middle bells always dodg until the Treble comes there. When the Treble leaves dodging before, every bell leads twice, except when the Treble lieth still behind, and then the two first bells make a dodg. *Bobs* are made as in *Grandsire Bob*, and the warning for them the same also with that.

Fourteen more Peals, composed at CAMBRIDGE.

Doubles and Singles on five Bells.

The Parasite. 1 and 5.

In this peal the Bells behind always dodg, except the Treble prevents them. When Treble is leaving the 3ds place hunting up, the bells before dodg at whole pulls, if Tenor be not one of them, until it parts them. The course of the bells in hunting is the same with *Tendring*.

	&c.

In this peal Treble hunteth as in *Tendring*. When Treble is in *third's* place hunting up, the bells dodg before at whole-pulls, till it comes and parts them. When it is in *third's* place hunting down the bells behind always dodg, except it leadeth, till it parts them. When Treble is before there are four changes of twenty four *doubles* and *singles*; whereof the first is brought in by the hunting of the bells. All the *singles* in the Twenty four are made in the *3d* and *4ths* place, except 1–2 before, then *extream* behind.

The Honey-suckle. 1 and 2.

In this peal every bell leads four times. While every bell but Treble is leading, the bells behind always dodg: every *4th* change is made by the four

foremost bells. When Treble is leading there are four changes of Twenty four *doubles* and *singles* made as in the former peal. The first change is on the four bells before.

Peals on 5 bells, with twelve Singles.

Blunderbus. 1——2.

In this peal every bell is a Hunt. When Treble and 2*d* are together either before or behind, the farthest bells from them dodg till either of them part, excepting the *extreams*. When the Treble is before a *single* in 3*d* and 4*th* place, which is unmade the next time except 1——2; for then the Hunts being together before, the bells behind must dodg according to the rule forementioned.

Weston Doubles. 1 and 5.

In this peal Treble is a perfect Hunt. Every other time Treble is leaving the 3ds place hunting up, the bells before dodg till it comes and parts them: the bells behind dodg but when Treble hinders them, except the *extremes* which are in 3d and 4ths place when it is 1——2 before; all the other *singles* are made behind when Treble is leading. It may be rang by making all the *singles* behind, by making the change before it is 1——2 on the bells before.

Peals on five bells with 10 singles.

The Antelope.

In this peal the bells hunt as in *Grandsire*. When Treble is before, a *single* is always made by the Tenor, and the bell which followeth it, except two *doubles* which are made as the *singles* in *Grandsire*. It may be rang like *Cambridg delight* either way by observing the same method if like *Cambridg delight* the common way; and by making the *singles* by the *half-hunt* and the bell before it, if like *Cambridg delight* the other way.

	&c.

This peal may be rang by hunting the Treble and Tenor as before, and it differeth from it only in this; when it is 1——5 behind in the hunting of the Treble, the bells before dodg till Tenor parts them; and when it is 1——5 before, in the hunting of the Tenor the bells behind dodg till Treble parts them: and then when Treble is the *whole-hunt* and Tenor *half*, it is plain *Cambridg delight* inverted. It may be rang by hunting the *half-hunt*, as in *Cambridg Delight the other way*, in either of those ways of ringing it, but then the *single* is always made by the hunting bell.

An example in that like *Cambridg Delight the other way*.

35421	15234	&c.

In this peal the bells hunt as in *Grandsire*, and it differeth from it in this, That there is not every other time a single *bob*, but in stead of a single one every other time a double one: so that only once in four times there is a single *bob*; when Tenor is dodging behind there is always a *single* made by it, and the bell which dodgeth with it if Treble leadeth, otherwise not.

1—4.

This peal may be rung like *Cambridg Delight*, if every other time the dodging before be omitted; or it may be rang by dodging constantly as in *Cambridg Delight*, by making double *bobs* and single *bobs* as in *Grandsire*: it may likewise be rang by making the course of the *half-hunt* in all the ways of ringing it the same with *Cambridg delight the other way*; observing in all of them to make the *singles* as before directed.

An example of that like *Cambridg Delight the other way*, in which the dodging before is every other time omitted. 1—4.

132546	153624	
135264	156342	

In this peal are 720 changes, which are all *doubles* except 12 *singles* which are made as in Plain *trebles* and *doubles*. *Treble* is a perfect Hunt, and except the *dodges* (which are the same as in *Oxford double Bob*) every double change is made by the *treble* and the three next bells to it: observing always that the bell in *Tenor's* place lieth still 'till it giveth place to the *Treble*, or be removed by a *dodg* behind when the *Treble* is before. When *Treble* leaveth *3ds* place hunting up, the bell that then comes before, leads thrice, and likewise the next bell after it till *Treble* cometh back into *3ds* place again; at all other times every bell leads twice. The bell in *Tenor's* place lieth five times behind, (and when the *single* is made in the middle *ten*

times) till *treble* remove it; and when *treble* comes back it lieth five times more behind, and then is displaced by a dodg behind and hunts down at whole-pulls. This peal may be rang by making *bobs* single and double as in *Grandsire Bob* with but two *singles* or two *trebles*, which must be made just Eighteen score changes one from the other.

The Nightingall. 1. 2. and 3.

In this peal are 720 changes, which are all *doubles* except twelve *singles*, which are made as in the former peal; and if you ring *Grandsire Bob* upon it, there may be but two *singles*, or else two *trebles*, as in the *Marigold*. *Treble* is a perfect Hunt: the bells in *4th* and *5th* places dodg till *treble* parts them, and then the two foremost bells do the like for eight changes together till *treble* hinders them, and gives way to the other two bells to dodg again in the *4th* and *5th* places, which is always for three changes and no more, except when the *single* is made in that place, and then they dodg six times. When *treble* is behind, dodg the four first; when it is before on the four last, as in *Marigold*.

CAMPANALOGIA: OR THE ART OF RINGING IMPROVED ***

Updated editions will replace the previous one—the old editions will be renamed.

Creating the works from print editions not protected by U.S. copyright law means that no one owns a United States copyright in these works, so the Foundation (and you!) can copy and distribute it in the United States without permission and without paying copyright royalties. Special rules, set forth in the General Terms of Use part of this license, apply to copying and distributing Project Gutenberg™ electronic works to protect the PROJECT GUTENBERG™ concept and trademark. Project Gutenberg is a registered trademark, and may not be used if you charge for an eBook, except by following the terms of the trademark license, including paying royalties for use of the Project Gutenberg trademark. If you do not charge anything for copies of this eBook, complying with the trademark license is very easy. You may use this eBook for nearly any purpose such as creation of derivative works, reports, performances and research. Project Gutenberg eBooks may be modified and printed and given away—you may do practically ANYTHING in the United States with eBooks not protected by U.S. copyright law. Redistribution is subject to the trademark license, especially commercial redistribution.

START: FULL LICENSE

THE FULL PROJECT GUTENBERG LICENSE

PLEASE READ THIS BEFORE YOU DISTRIBUTE OR USE THIS WORK

To protect the Project Gutenberg™ mission of promoting the free distribution of electronic works, by using or distributing this work (or any other work associated in any way with the phrase “Project Gutenberg”), you agree to comply with all the terms of the Full Project Gutenberg™ License available with this file or online at www.gutenberg.org/license.

Section 1. General Terms of Use and Redistributing Project Gutenberg™ electronic works

1.A. By reading or using any part of this Project Gutenberg™ electronic work, you indicate that you have read, understand, agree to and accept all the terms of this license and intellectual property (trademark/copyright) agreement. If you do not agree to abide by all the terms of this agreement, you must cease using and return or destroy all copies of Project Gutenberg™ electronic works in your possession. If you paid a fee for obtaining a copy of or access to a Project Gutenberg™ electronic work and you do not agree to be bound by the terms of this agreement, you may obtain a refund from the person or entity to whom you paid the fee as set forth in paragraph 1.E.8.

1.B. “Project Gutenberg” is a registered trademark. It may only be used on or associated in any way with an electronic work by people who agree to be bound by the terms of this agreement. There are a few things that you can do with most Project Gutenberg™ electronic works even without complying with the full terms of this agreement. See paragraph 1.C below. There are a lot of things you can do with Project Gutenberg™ electronic works if you follow the terms of this agreement and help preserve free future access to Project Gutenberg™ electronic works. See paragraph 1.E below.

1.C. The Project Gutenberg Literary Archive Foundation (“the Foundation” or PGLAF), owns a compilation copyright in the collection of Project Gutenberg™ electronic works. Nearly all the individual works in the collection are in the public domain in the

United States. If an individual work is unprotected by copyright law in the United States and you are located in the United States, we do not claim a right to prevent you from copying, distributing, performing, displaying or creating derivative works based on the work as long as all references to Project Gutenberg are removed. Of course, we hope that you will support the Project Gutenberg™ mission of promoting free access to electronic works by freely sharing Project Gutenberg™ works in compliance with the terms of this agreement for keeping the Project Gutenberg™ name associated with the work. You can easily comply with the terms of this agreement by keeping this work in the same format with its attached full Project Gutenberg™ License when you share it without charge with others.

1.D. The copyright laws of the place where you are located also govern what you can do with this work. Copyright laws in most countries are in a constant state of change. If you are outside the United States, check the laws of your country in addition to the terms of this agreement before downloading, copying, displaying, performing, distributing or creating derivative works based on this work or any other Project Gutenberg™ work. The Foundation makes no representations concerning the copyright status of any work in any country other than the United States.

1.E. Unless you have removed all references to Project Gutenberg:

1.E.1. The following sentence, with active links to, or other immediate access to, the full Project Gutenberg™ License must appear prominently whenever any copy of a Project Gutenberg™ work (any work on which the phrase “Project Gutenberg” appears, or with which the phrase “Project Gutenberg” is associated) is accessed, displayed, performed, viewed, copied or distributed:

This eBook is for the use of anyone anywhere in the United States and most other parts of the world at no cost and with almost no restrictions whatsoever. You may copy it, give it away or re-use it under the terms of the Project Gutenberg License included with this eBook or online at www.gutenberg.org. If you are not located

in the United States, you will have to check the laws of the country where you are located before using this eBook.

1.E.2. If an individual Project Gutenberg™ electronic work is derived from texts not protected by U.S. copyright law (does not contain a notice indicating that it is posted with permission of the copyright holder), the work can be copied and distributed to anyone in the United States without paying any fees or charges. If you are redistributing or providing access to a work with the phrase “Project Gutenberg” associated with or appearing on the work, you must comply either with the requirements of paragraphs 1.E.1 through 1.E.7 or obtain permission for the use of the work and the Project Gutenberg™ trademark as set forth in paragraphs 1.E.8 or 1.E.9.

1.E.3. If an individual Project Gutenberg™ electronic work is posted with the permission of the copyright holder, your use and distribution must comply with both paragraphs 1.E.1 through 1.E.7 and any additional terms imposed by the copyright holder. Additional terms will be linked to the Project Gutenberg™ License for all works posted with the permission of the copyright holder found at the beginning of this work.

1.E.4. Do not unlink or detach or remove the full Project Gutenberg™ License terms from this work, or any files containing a part of this work or any other work associated with Project Gutenberg™.

1.E.5. Do not copy, display, perform, distribute or redistribute this electronic work, or any part of this electronic work, without prominently displaying the sentence set forth in paragraph 1.E.1 with active links or immediate access to the full terms of the Project Gutenberg™ License.

1.E.6. You may convert to and distribute this work in any binary, compressed, marked up, nonproprietary or proprietary form, including any word processing or hypertext form. However, if you provide access to or distribute copies of a Project Gutenberg™ work in a format other than “Plain Vanilla ASCII” or other format used in the official version posted on the official Project Gutenberg™ website

(www.gutenberg.org), you must, at no additional cost, fee or expense to the user, provide a copy, a means of exporting a copy, or a means of obtaining a copy upon request, of the work in its original “Plain Vanilla ASCII” or other form. Any alternate format must include the full Project Gutenberg™ License as specified in paragraph 1.E.1.

1.E.7. Do not charge a fee for access to, viewing, displaying, performing, copying or distributing any Project Gutenberg™ works unless you comply with paragraph 1.E.8 or 1.E.9.

1.E.8. You may charge a reasonable fee for copies of or providing access to or distributing Project Gutenberg™ electronic works provided that:

- You pay a royalty fee of 20% of the gross profits you derive from the use of Project Gutenberg™ works calculated using the method you already use to calculate your applicable taxes. The fee is owed to the owner of the Project Gutenberg™ trademark, but he has agreed to donate royalties under this paragraph to the Project Gutenberg Literary Archive Foundation. Royalty payments must be paid within 60 days following each date on which you prepare (or are legally required to prepare) your periodic tax returns. Royalty payments should be clearly marked as such and sent to the Project Gutenberg Literary Archive Foundation at the address specified in Section 4, “Information about donations to the Project Gutenberg Literary Archive Foundation.”
- You provide a full refund of any money paid by a user who notifies you in writing (or by e-mail) within 30 days of receipt that s/he does not agree to the terms of the full Project Gutenberg™ License. You must require such a user to return or destroy all copies of the works possessed in a physical medium and discontinue all use of and all access to other copies of Project Gutenberg™ works.
- You provide, in accordance with paragraph 1.F.3, a full refund of any money paid for a work or a replacement copy, if a defect in the electronic work is discovered and reported to you within 90 days of receipt of the work.

- You comply with all other terms of this agreement for free distribution of Project Gutenberg™ works.

1.E.9. If you wish to charge a fee or distribute a Project Gutenberg™ electronic work or group of works on different terms than are set forth in this agreement, you must obtain permission in writing from the Project Gutenberg Literary Archive Foundation, the manager of the Project Gutenberg™ trademark. Contact the Foundation as set forth in Section 3 below.

1.F.

1.F.1. Project Gutenberg volunteers and employees expend considerable effort to identify, do copyright research on, transcribe and proofread works not protected by U.S. copyright law in creating the Project Gutenberg™ collection. Despite these efforts, Project Gutenberg™ electronic works, and the medium on which they may be stored, may contain “Defects,” such as, but not limited to, incomplete, inaccurate or corrupt data, transcription errors, a copyright or other intellectual property infringement, a defective or damaged disk or other medium, a computer virus, or computer codes that damage or cannot be read by your equipment.

1.F.2. LIMITED WARRANTY, DISCLAIMER OF DAMAGES - Except for the “Right of Replacement or Refund” described in paragraph 1.F.3, the Project Gutenberg Literary Archive Foundation, the owner of the Project Gutenberg™ trademark, and any other party distributing a Project Gutenberg™ electronic work under this agreement, disclaim all liability to you for damages, costs and expenses, including legal fees. YOU AGREE THAT YOU HAVE NO REMEDIES FOR NEGLIGENCE, STRICT LIABILITY, BREACH OF WARRANTY OR BREACH OF CONTRACT EXCEPT THOSE PROVIDED IN PARAGRAPH 1.F.3. YOU AGREE THAT THE FOUNDATION, THE TRADEMARK OWNER, AND ANY DISTRIBUTOR UNDER THIS AGREEMENT WILL NOT BE LIABLE TO YOU FOR ACTUAL, DIRECT, INDIRECT, CONSEQUENTIAL, PUNITIVE OR INCIDENTAL DAMAGES

EVEN IF YOU GIVE NOTICE OF THE POSSIBILITY OF SUCH DAMAGE.

1.F.3. LIMITED RIGHT OF REPLACEMENT OR REFUND - If you discover a defect in this electronic work within 90 days of receiving it, you can receive a refund of the money (if any) you paid for it by sending a written explanation to the person you received the work from. If you received the work on a physical medium, you must return the medium with your written explanation. The person or entity that provided you with the defective work may elect to provide a replacement copy in lieu of a refund. If you received the work electronically, the person or entity providing it to you may choose to give you a second opportunity to receive the work electronically in lieu of a refund. If the second copy is also defective, you may demand a refund in writing without further opportunities to fix the problem.

1.F.4. Except for the limited right of replacement or refund set forth in paragraph 1.F.3, this work is provided to you 'AS-IS', WITH NO OTHER WARRANTIES OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY OR FITNESS FOR ANY PURPOSE.

1.F.5. Some states do not allow disclaimers of certain implied warranties or the exclusion or limitation of certain types of damages. If any disclaimer or limitation set forth in this agreement violates the law of the state applicable to this agreement, the agreement shall be interpreted to make the maximum disclaimer or limitation permitted by the applicable state law. The invalidity or unenforceability of any provision of this agreement shall not void the remaining provisions.

1.F.6. INDEMNITY - You agree to indemnify and hold the Foundation, the trademark owner, any agent or employee of the Foundation, anyone providing copies of Project Gutenberg™ electronic works in accordance with this agreement, and any volunteers associated with the production, promotion and distribution of Project Gutenberg™ electronic works, harmless from all liability, costs and expenses, including legal fees, that arise directly or indirectly from any of the following which you do or cause to occur: (a)

distribution of this or any Project Gutenberg™ work, (b) alteration, modification, or additions or deletions to any Project Gutenberg™ work, and (c) any Defect you cause.

Section 2. Information about the Mission of Project Gutenberg™

Project Gutenberg™ is synonymous with the free distribution of electronic works in formats readable by the widest variety of computers including obsolete, old, middle-aged and new computers. It exists because of the efforts of hundreds of volunteers and donations from people in all walks of life.

Volunteers and financial support to provide volunteers with the assistance they need are critical to reaching Project Gutenberg™'s goals and ensuring that the Project Gutenberg™ collection will remain freely available for generations to come. In 2001, the Project Gutenberg Literary Archive Foundation was created to provide a secure and permanent future for Project Gutenberg™ and future generations. To learn more about the Project Gutenberg Literary Archive Foundation and how your efforts and donations can help, see Sections 3 and 4 and the Foundation information page at www.gutenberg.org.

Section 3. Information about the Project Gutenberg Literary Archive Foundation

The Project Gutenberg Literary Archive Foundation is a non-profit 501(c)(3) educational corporation organized under the laws of the state of Mississippi and granted tax exempt status by the Internal Revenue Service. The Foundation's EIN or federal tax identification number is 64-6221541. Contributions to the Project Gutenberg Literary Archive Foundation are tax deductible to the full extent permitted by U.S. federal laws and your state's laws.

The Foundation's business office is located at 809 North 1500 West, Salt Lake City, UT 84116, (801) 596-1887. Email contact links and up

to date contact information can be found at the Foundation's website and official page at www.gutenberg.org/contact

Section 4. Information about Donations to the Project Gutenberg Literary Archive Foundation

Project Gutenberg™ depends upon and cannot survive without widespread public support and donations to carry out its mission of increasing the number of public domain and licensed works that can be freely distributed in machine-readable form accessible by the widest array of equipment including outdated equipment. Many small donations (\$1 to \$5,000) are particularly important to maintaining tax exempt status with the IRS.

The Foundation is committed to complying with the laws regulating charities and charitable donations in all 50 states of the United States. Compliance requirements are not uniform and it takes a considerable effort, much paperwork and many fees to meet and keep up with these requirements. We do not solicit donations in locations where we have not received written confirmation of compliance. To SEND DONATIONS or determine the status of compliance for any particular state visit www.gutenberg.org/donate.

While we cannot and do not solicit contributions from states where we have not met the solicitation requirements, we know of no prohibition against accepting unsolicited donations from donors in such states who approach us with offers to donate.

International donations are gratefully accepted, but we cannot make any statements concerning tax treatment of donations received from outside the United States. U.S. laws alone swamp our small staff.

Please check the Project Gutenberg web pages for current donation methods and addresses. Donations are accepted in a number of other ways including checks, online payments and credit card donations. To donate, please visit: www.gutenberg.org/donate.

Section 5. General Information About Project Gutenberg™ electronic works

Professor Michael S. Hart was the originator of the Project Gutenberg™ concept of a library of electronic works that could be freely shared with anyone. For forty years, he produced and distributed Project Gutenberg™ eBooks with only a loose network of volunteer support.

Project Gutenberg™ eBooks are often created from several printed editions, all of which are confirmed as not protected by copyright in the U.S. unless a copyright notice is included. Thus, we do not necessarily keep eBooks in compliance with any particular paper edition.

Most people start at our website which has the main PG search facility: www.gutenberg.org.

This website includes information about Project Gutenberg™, including how to make donations to the Project Gutenberg Literary Archive Foundation, how to help produce our new eBooks, and how to subscribe to our email newsletter to hear about new eBooks.
